SAFETY INSTRUCTIONS

The following instructions must be observed.

- This instrument was designed and is checked in accordance with regulations in force EN 60950 (“Safety of information technology equipment, including electrical business equipment”).
A hazardous situation may occur if this instrument is not used for its intended purpose or is used incorrectly. Please note operating instructions provided in this manual.
- The instrument must be installed, operated and maintained by personnel who have been properly trained. Personnel must read and understand this manual prior to installation and operation of the instrument.
- The manufacturer assumes no liability for damage caused by incorrect use of the instrument or for modifications or changes made to the instrument.

Technical Improvements

- The manufacturer reserves the right to modify technical data without prior notice.

1. Introduction

1.1 Unit Description:

The ES-762 Flow Computer primarily satisfies the instrument requirements for a variety of flowmeter types in liquid, steam and heat applications. Multiple flow equations are available in a single instrument with many advanced features. Two auxiliary current and four totalizer inputs are provided for secondary measurements.

The alphanumeric display offers measured parameters in easy to understand format. Manual access to measurements and display scrolling is supported

The versatility of the Flow Computer permits a wide measure of versatility within the instrument package. The various hardware inputs and outputs can be "soft" assigned to meet a variety of common application needs. The user "soft selects" the usage of each input/output while configuring the instrument. Multichannel auxiliary inputs can gather other information from site.

Applications Include:

Steam Mass, Steam Heat, Chilled Water Only, Heated Water Only including Low DeltaT cutoff.

The isolated analog output can be chosen to follow the volume flow, heat flow, mass flow, temperature, pressure, or density by means of a menu selection. Most hardware features are assignable by this method.

The user can assign the standard RS-232 Serial Port for external data logging, transaction printing, or for connection to a modem for remote meter reading.

A Service or Test mode is provided to assist the user during start-up system check out by monitoring inputs and exercising outputs. The system setup can also be printed.

1.2 Specifications:

Environmental

Operating Temperature: 0 to +50 C
 Storage Temperature: -40 to +85 C
 Humidity : 0-95% Non-condensing
 Materials: UL, CSA, VDE approved

Display

Type: 2 lines of 20 characters
 Types: Backlit LCD and VFD ordering options
 Character Size: 0.3" nominal
 User selectable label descriptors and units of measure

Keypad

Keypad Type: Membrane Keypad
 Keypad Rating: Sealed to Nema 4
 Number of keys: 16

Enclosure

Enclosure Options: Panel & Wall Mounting Styles
 Size: See Dimensions
 Depth behind panel: 6.5" including mating connector
 Type: DIN
 Materials: Plastic, UL94V-0, Flame retardant
 Bezel: Textured per matt finish

Power Input

The factory equipped power option is internally fused. An internal line to line filter capacitor is provided for added transient suppression. MOV protection for surge transient is also supported

Universal AC Power: 85 to 276 Vrms, 50/60 Hz
 DC Power Option: 24 VDC (16 to 48 VDC)
 Power Consumption
 AC Power: 6.5 V/A
 DC Power: 300 mA max.

Flow Meter Types:

Linear: Vortex, Turbine, Positive Displacement, Magnetic, GilFlo, ILVA, Ultrasonic, Mass Flow and others
 Square Law: Orifice, Venturi, Nozzle, V-Cone, Wedge, Averaging Pitot, Target, Accelabar and others
 Multi-Point Linearization: May be used with all flowmeter types. Including: 16 point, UVC and dynamic compensation.

Flow Inputs for Primary Flow Computations:

Analog Input:

Accuracy: 0.02% FS at 20° C

Ranges

Voltage: 0-10 VDC, 0-5 VDC, 1-5 VDC

Current: 4-20 mA, 0-20 mA,

4-20 mA stacked, 0-20 mA stacked

Basic Measurement Resolution: 16 bit

Update Rate: 4 updates/sec

Automatic Fault detection: Signal over/under-range, Current Loop Broken

Calibration: Operator assisted learn mode

Extended calibration: Learns Zero and Full Scale of each range

Fault Protection:

Fast Transient: 500 V Protection (capacitive clamp)

Reverse Polarity: No ill effects

Over-Voltage Limit: 50 VDC Over voltage protection

Over-Current Protection: Internally current limited protected to 24VDC

Pulse Inputs:

Number of Flow Inputs: one

Input Impedance: 10 k Ω nominal

Trigger Level: (menu selectable)

High Level Input

Logic On: 2.5 to 30 VDC

Logic Off: 0 to 2 VDC

Low Level Input (mag pickup)

Selectable sensitivity: 10 mV and 100 mV

Minimum Count Speed: 0.25 Hz (to maintain rate display)

Maximum Count Speed: Selectable: 0 to 50 kHz

Overvoltage Protection: 50 VDC

Secondary Totalizer Aux. Inputs:

Input Type: Contact Closure / Pulse
 Number of Contact Closure / Pulse Inputs: four (4)
 Input Impedance: 4.7 k Ω nominal
 Trigger Level:
 High Level Input
 Logic On: 4 to 30 VDC
 Logic Off: 0 to 1 VDC
 Maximum Count Speed: 25 Hz
 Excitation Voltage: 5 VDC
 Overvoltage Protection: 30 VDC
 User defined: units, scaling, rollover limit, labels
 Uses: Cold Water, Natural Gas, Hot Water, Electric kW-Hr

Temperature, Pressure, Density, and Aux 3/4 Inputs

The compensation inputs usage are menu selectable for temperature, temperature 2, pressure, density or not used. In addition, two auxiliary inputs are provided for secondary measurements.

Calibration: Operator assisted learn mode
 Operation: Ratiometric
 Accuracy: 0.02% FS at 20° C (current input)
 Basic Measurement Resolution: 16 bit
 Update Rate: 2 updates/sec minimum
 Automatic Fault detection:
 Signal Over-range/under-range
 Current Loop Broken
 RTD short
 RTD open
 Reverse Polarity: No ill effects
 Over-Current Limit
 (current input) Internally limited to protect input to 24 VDC
 Available Input Ranges (menu selectable)
 Current: 4-20 mA, 0-20 mA (4 inputs)
 Resistance: 100 Ohms DIN RTD (2 inputs)
 100 Ohm DIN RTD (DIN 43-760, BS 1904):
 Three Wire Lead Compensation
 Internal RTD linearization learns ice point resistance
 1 mA Excitation current with reverse polarity protection
 Temperature Resolution: 0.01 C
 Accuracy: 0.5° C

Stored Information (ROM)

Steam Tables (saturated & superheated),
 Fluid Properties: Water, or Generic with user entries of fluid properties

User Entered Stored Information (EEPROM / Nonvolatile RAM)

Transmitter Ranges, Signal Types
 Fluid Properties
 (reference density, expansion factor, specific heat, viscosity, isentropic exponent, combustion heating value)
 Units Selections (English/Metric)

Excitation Voltage

24 VDC @ 140 mA (fault protected)

Relay Outputs

The relay outputs usage is menu assignable to (Individually for each relay) Hi/Lo Rate Alarm, Hi/Lo Temperature Alarm, Hi/Lo Pressure Alarm, Pulse Output (pulse options), Aux.3, Aux.4, Wet Steam or General purpose warning (security), Aux Totals 1, 2, 3, 4.

Number of relays: 2
 Contact Style: Form C contacts
 Contact Ratings: 240 V, 5 amp

Analog Outputs

The analog outputs are menu assignable to correspond to the Uncompensated Volume Rate, Aux.3, Aux.4, Mass Rate, Heat Rate, Temperature, Density, or Pressure.

Number of Outputs: 2
 Type: Isolated Current Sourcing (shared common)
 Available Ranges: 0-20 mA, 4-20 mA (menu selectable)
 Resolution: 16 bit
 Accuracy: 0.05% FS at 20 Degrees C
 Update Rate: 5 updates/sec
 Temperature Drift: Less than 200 ppm/C
 Maximum Load: 1000 ohms
 Compliance Effect: Less than .05% Span
 60 Hz rejection: 40 dB minimum
 EMI: No effect at 3 V/M
 Calibration: Operator assisted Learn Mode
 Averaging: User entry of DSP Averaging constant to cause a smooth control action

Listing: CE Compliant, UL, C-UL Pending

Serial Communication

The serial port can be used for printing, datalogging, modem connection and communication with a computer. Power is provided for KEP's MPP2400N (modem) communication accessory.

RS-232:
 Device ID: 01-99
 Baud Rates: 300, 1200, 2400, 9600
 Parity: None, Odd, Even
 Handshaking: None, Software, Hardware
 Print Setup: Configurable print list and formatting, Compatible with external dataloggers.

RS-485:
 Device ID: 01-247
 Baud Rates: 300, 1200, 2400, 4800, 9600, 19200
 Parity: None, Odd, Even
 Protocol: Modbus RTU (Half Duplex)

Data Logging

The data logger captures print list information to internal storage for approximately 5000 transactions. This information can be used for later uploading or printing. Storage format is selectable for Comma-Carriage Return or Printer formats.

Isolated Pulse output

The isolated pulse output is menu assignable to Uncompensated Volume Total, Heat Total or Mass Total, Aux Totals 1, 2, 3, 4.

Pulse Output Form (menu selectable): Open Collector NPN or 24 VDC voltage pulse

Nominal On Voltage: 24 VDC

Maximum Sink Current: 25 mA

Maximum Source Current: 25 mA

Maximum Off Voltage: 30 VDC

Saturation Voltage: 0.4 VDC

Pulse Duration: User selectable

Pulse output buffer: 8 bit

Fault Protection

Reverse polarity: Shunt Diodes

Over-current Protected

Over-voltage Protected

Real Time Clock

The Flow Computer is equipped with a battery backed non-volatile real time clock with display of time and date.

Format:

24 hour format for time

Day, Month, Year for date

Measurement

The Flow Computer can be thought of as making a series of measurements of flow, temperature/density and pressure sensors and then performing calculations to arrive at a result(s) which is then updated periodically on the display. The analog outputs, the pulse output, and the alarm relays are also updated. The cycle then repeats itself.

Step 1: Update the measurements of input signals-

Raw Input Measurements are made at each input using equations based on input signal type selected. The system notes the "out of range" input signal as an alarm condition.

Step 2: Compute the Flowing Fluid Parameters-

The temperature, pressure, viscosity and density equations are computed as needed based on the flow equation and input usage selected by the user.

Step 3 : Compute the Volumetric Flow-

Volumetric flow is the term given to the flow in volume units.

The value is computed based on the flowmeter input type selected and augmented by any performance enhancing linearization that has been specified by the user.

Step 4: Compute the Corrected Volume Flow at Reference Conditions-

In the case of a corrected liquid or gas volume flow calculation, the corrected volume flow is computed as required by the selected compensation equation.

Step 5 : Compute the Mass Flow-

All required information is now available to compute the mass flow rate as volume flow times density. A heat flow computation is also made if required.

Step 6: Check Flow Alarms-

The flow alarm functions have been assigned to one of the above flow rates during the setup of the instrument. A comparison is now made by comparing the current flow rates against the specified hi and low limits.

Step 7: Compute the Analog Output-

This designated flow rate value is now used to compute the analog output.

Step 8: Compute the Flow Totals by Summation-

A flow total increment is computed for each flow rate. This increment is computed by multiplying the respective flow rate by a time base scaler and then summing. The totalizer format also includes provisions for total rollover.

Step 9: Pulse Output Service-

The pulse output is next updated by scaling the total increment which has just been determined by the pulse output scaler and summing it to any residual pulse output amount.

Step 10: Update Display and Printer Output-

The instrument finally runs a task to update the various table entries associated with the front panel display and serial outputs.

Instrument Setup

The setup is password protected by means of a numeric lock out code established by the user. The help line and units of measure prompts assure easy entry of parameters.

An EZ Setup function is supported to rapidly configure the instrument for first time use. A software program is also available which runs on a PC using a RS-232 Serial for connection to the Flow Computer. Illustrative examples may be down loaded in this manner.

The standard setup menu has numerous subgrouping of parameters needed for flow calculations. There is a well conceived hierarchy to the setup parameter list. Selections made at the beginning of the setup automatically affect offerings further down in the lists, minimizing the number of questions asked of the user.

In the setup menu, the flow computer activates the correct setup variables based on the instrument configuration, the flow equation, and the hardware selections made for the compensation transmitter type, the flow transmitter type, and meter enhancements (linearization) options selected. All required setup parameters are enabled. All setup parameters not required are suppressed.

Also note that in the menu are parameter selections which have preassigned industry standard values. The unit will assume these values unless they are modified by the user.

Most of the process input variables have available a "default" or emergency value which must be entered. These are the values that the unit assumes when a malfunction is determined to have occurred on the corresponding input.

It is possible to enter in a nominal constant value for temperature or density, or pressure inputs by placing the desired nominal value into the default values and selecting "manual". This is also a convenience when performing bench top tests without simulators.

The system also provides a minimum implementation of an "audit trail" which tracks significant setup changes to the unit. This feature is increasingly being found of benefit to users or simply required by Weights and Measurement Officials in systems used in commerce, trade, or "custody transfer" applications.

Simulation and Self Checking:

This mode provides a number of specialized utilities required for factory calibration, instrument checkout on start-up, and periodic calibration documentation.

A service password is required to gain access to this specialized mode of operation. Normally quality, calibration, and maintenance personnel will find this mode of operation very useful.

Many of these tests may be used during start-up of a new system. Output signals may be exercised to verify the electrical interconnects before the entire system is put on line.

The following action items may be performed in the Diagnostic Mode:

- Print Calibration/Maintenance Report
- View Signal Input (Voltage, Current, Resistance, Frequency)
- Examine Audit Trail
- Perform a Self Test
- Perform a Service Test
- View Error History
- Perform Pulse Output Checkout / Simulation
- Perform Relay Output Checkout / Simulation
- Perform Analog Output Checkout / Simulation
- Calibrate Analog Inputs using the Learn Feature
- Calibrate Analog Output using the Learn Feature
- Schedule Next Maintenance Date

Note that a calibration of the analog input/output will advance the audit trail counters since it effects the accuracy of the system.

Operation of Steam Trap Monitor

In applications on Saturated Steam, the otherwise unused Compensation Input may be connected to a steam trap monitor that offers the following compatible output signal levels:

- 4mA = trap cold
- 12 mA = trap warm and open (blowing)
- 20 mA = trap warm and closed

In normal operation a steam trap is warm and periodically opens and closes in response to the accumulation of condensate. A cold trap is indication that it is not purging the condensate, a trap that is constantly blowing is an indication that it is stuck open. To avoid a false alarm, the Supertrol-2 permits the user to program a

delay, or time period, which should be considered normal for the trap to be either cold, or open. An alarm will only be activated if the trap is detected as continuously being in the abnormal states for a time period greater than this TRAP ERROR DELAY time.

The user selects to use the Compensation Input for Trap Monitoring by selecting "4-20mA TRAP STATUS as the INPUT SIGNAL for OTHER INPUT1.

The user can program the ERROR DELAY time in HH:MM format into both the TRAP ERROR DELAY (cold trap error) menu and the TRAP BLOWING DELAY (trap stuck open) menu.

The ST2 will warn the operator of a TRAP ERROR when an abnormal condition is detected. The error can be acknowledged by pressing the ENTER key. However, the problem may reassert itself if there is a continued problem with the steam trap.

In addition, the event is noted in the ERROR LOG.

It is also possible for the user to program a trap malfunction as one of the conditions worthy of a CALL OUT of a problem by selecting this error in the ERROR MASK.

The Data-Logging option of the ST2 can also be used to log the performance of the trap by storing the % of time the trap has been cold, and/or blowing open during the datalog interval.

Datalogging Option

The Datalogging Option for the ST2 permits the user to automatically store sets of data items as a record on a periodic basis. A datalog record may be stored as the result of either a PRINT key depression, or an INTERVAL, or a TIME OF DAY request for a datalog.

The user defines the list of items to be included in each datalog by selecting these in the PRINT LIST menu located within the COMMUNICATIONS SUBMENU.

The user selects what will trigger a datalog record being stored in the PRINT INITIATE menu. The choices are PRINT KEY, INTERVAL, and TIME OF DAY.

The user can select the datalog store interval in a HH:MM format in the PRINT INTERVAL menu.

The user can also select the store time of day in a 24 hr HH:MM format in the PRINT TIME menu.

The user can also define whether he just wants the data stored into the datalogger, or if he wants the data both stored in the datalogger and sent out over the RS232 port in the DATALOG ONLY menu.

The user can define the format he wishes the data to be output in using the DATALOG FORMAT menu. Choices are PRINTER and DATABASE. PRINTER format will output the data records in a form suitable to dump to a printer. DATABASE format will output the values in a CSV, or Comma Separated Variable with Carriage return delimiting of each record.

A number of serial commands are also included to access and manipulate information stored with in the datalogger. Among these RS232 command capabilities are the following actions:

- Clear Data Logger
- Send all Data in Datalogger
- Send Only New Data since Datalogger was last Read
- Send Data for the date included in the request
- Send the column heading text for the CSV data fields
- Send the column units of measure text for the CSV data fields
- Store one new record into datalogger now
- Read Number of New Records in the datalogger
- Read number of records currently in the datalogger
- Read the maximum number of records capacity of the datalogger
- Move Pointer Back N records
- Dump Record at Pointer
- Dump records newer than pointer
- Dump data from N records back

The datalogger option is used in conjunction with the RS-232 port in remote metering applications.

The technical details associated with the serial commands are listed in Universal Serial Protocol Manual available upon request.

RS-232 Serial Port

The Flow Computer has a general purpose RS-232 Port which may be used for any one of the following purposes:

- Transaction Printing
- Data Logging
- Remote Metering by Modem
- Computer Communication Link
- Configuration by Computer
- Print System Setup
- Print Calibration/Malfunction History

Instrument Setup by PC's over Serial Port

A Diskette program is provided with the Flow Computer that enables the user to rapidly configure the Flow Computer using an Personnel Computer. Included on the diskette are common instrument applications which may be used as a starting point for your application. This permits the user to have an excellent starting point and helps speed the user through the instrument setup.

Operation of Serial Communication Port with Printers

The Flow Computer's RS-232 channel supports a number of operating modes. One of these modes is intended to support operation with a printer in metering applications requiring transaction printing, data logging and/or printing of calibration and maintenance reports.

For transaction printing, the user defines the items to be included in the printed document. The user can also select what initiates the transaction print generated as part of the setup of the instrument. The transaction document may be initiated via a front panel key depression.

In data logging, the user defines the items to be included in each data log as a print list. The user can also select when

or how often he wishes a data log to be made. This is done during the setup of the instrument as either a time of day or as a time interval between logging.

The system setup and maintenance report list all the instrument setup parameters and usage for the current instrument configuration. In addition, the Audit trail information is presented as well as a status report listing any observed malfunctions which have not been corrected.

The user initiates the printing of this report at a designated point in the menu by pressing the print key on the front panel.

Operating Serial Communication Port with Modems

The ST2 offers a number of capabilities that facilitate its use with modems. The ST2's RS232 port can be connected to a modem in order to implement a remote metering system that uses either the phone companies standard phone lines or cellular telephone system. In addition to remote meter readings, the serial commands may also be used to examine and/or make setup changes to the unit, and to check for proper operation or investigate problems. Several hundred commands are supported. A compatible industrial modem accessory and interconnecting cabling is offered in the MPP2400N specifically designed for use with the ST2.

The ST2 and Modem can be used together to create systems with one or more of the following capabilities:

1. Poll the Supertrol-2 unit for information from a remote PC.
2. Call Out from the Supertrol-2 unit to a remote PC on a scheduled reading time and/or crisis basis
3. Some combination of the above two descriptions where the unit is polled by one PC and calls into to a different PC if a problem is detected.

In fact, up to five ST-2 units can share the same modem. Each ST2 must have a unique DEVICE ID. This multidropping of flow computers on a single modem is popular when there are several flow computers mounted near each other.

In most applications using modem communications, the ST2's RS232 USAGE is first set equal to MODEM. Each Supertrol-2 on a shared modem cable is given a unique serial device address or DEVICE ID. The BAUD RATE is commonly set to 2400, the PARITY set to NONE, and the HANSHAKING set to NONE to complete the basic setup. The remote PC's communication settings are chosen to match these.

The level of complexity of the Supetrol-2 to Modem connection can range from simple to more complex.

In a simple system a remote PC will call into the telephone number of the modem. The modem will answer the call, and establish a connection between the Supertrol-2 and the remote PC. An exchange of information can now occur. The Supertrol-2 will act as a slave and respond to commands and requests for information from the remote MASTER PC. The MASTER PC will end the exchange by handing up.

However, it is more common that the Supertrol-2 will be used to control the modem. In these applications the following communication menu settings would be used:

RS232 USAGE = MODEM
DEVICE ID, BAUD RATE, PARITY, and HANDSHAKING are set
MODEM CONTROL = YES
DEVICE MASTER = YES (When multidropping several ST2's, only one unit will be the DEVICE MASTER)
MODEM AUTO ANSWER = YES (This instructs the unit to answer incoming calls)
HANG UP IF INACTIVE = YES (This instructs the unit to hang up the line if no activities occur within several minutes). Set to NO when sharing a modem on a multidrop connection.

A more complex form of a remote metering system can be implemented where the Supertrol-2 will initiate a call to contact the remote PC at a scheduled time and/or in the event of a problem that has been detected. In these applications the Supertrol-2 has additional setup capabilities including:

The ST2 must have a unique identifier assigned to it (using the TAG NUMBER)
Call Out Telephone number must be entered in the CALL OUT NUMBER
The scheduled call out time for the daily reading must be entered in CALL OUT TIME
A decision must be made whether the unit will be used to call on error(s) in CALL ON ERROR
The particular error conditions to call out on must be defined in the ERROR MASK
The NUMBER OF REDIALS to be attempted if line is busy must be entered in that cell
HANG UP IF INACTIVE= YES will disconnect the call if remote computer does not respond.

Consult the Universal Serial Commands User Manual for details on the individual commands supported by the Supertrol-2. Contact the KEP Flow Applications Group for a discussion on the remote metering system capabilities you are considering.

NOTE: Some modems can be configured in advance to answer incoming calls, terminate phone connections if communications is lost. In such applications there may be no need for the Supertrol-2 to be functioning to "control" the modem. Setting the RS233 USAGE = COMPUTER will likely work.

RS-485 Serial Port (optional)

The RS-485 serial port can be used for accessing flow rate, total, pressure, temperature, density and alarm status information. The port can also be used for changing presets and acknowledging alarms.

2.0 Installation

2.1 Mounting Diagram:

2.2 Mounting Procedure:

General Mounting Hints:

The ES-762 Flow Computer should be located in an area with a clean, dry atmosphere which is relatively free of shock and vibration. The unit is installed in a 5.43" (138mm) wide by 2.68" (68mm) high panel cutout. (see Mounting Dimensions) To mount the Flow Computer, proceed as follows:

- a. Prepare the panel opening.
- b. Slide the unit through the panel cutout until the it touches the panel.
- c. Install the screws (provided) in the mounting bracket and slip the bracket over the rear of the case until it snaps in place.
- d. Tighten the screws firmly to attach the bezel to the panel. 3 in. lb. of torque must be applied and the bezel must be parallel to the panel.

NOTE: To seal to NEMA4X / IP65 specifications, supplied bezel kit must be used and panel cannot flex more than 0.010".

When the optional bezel kit is used, the bezel adaptor must be sealed to the case using an RTV type sealer to maintain NEMA4X / IP65 rating.

3.0 Applications

STEAM MASS

3.1 Steam Mass

Measurements:

A flowmeter measures the actual volume flow in a steam line. A temperature and/or pressure sensor is installed to measure temperature and/or pressure. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- Density and mass flow are calculated using the steam tables stored in the flow computer.
- With square law device measurement the actual volume is calculated from the differential pressure, taking into account temperature and pressure compensation.
- Saturated steam requires either a pressure or temperature measurement with the other variable calculated using the saturated steam curve.
- Totalization with scaling and rollover limits on Auxiliary Inputs 1,2,3 and 4
- Optional steam trap monitoring using Compensation Input 1.
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Input Variables:

Superheated Steam: Flow, temperature and pressure

Saturated Steam: Flow, temperature or pressure

Output Results:

- Display Results
Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Mass or Volume Flow Rate, Temperature, Pressure Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4)
- Pulse Output
Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Mass or Volume Flow Rate , Total, Pressure, Temperature, Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4

Applications:

Monitoring mass flow and total of steam. Flow alarms are provided via relays and datalogging is available via analog (4-20mA) and serial outputs.

Steam Mass Illustration

Calculations

Mass Flow

$$\text{Mass Flow} = \text{volume flow} \cdot \text{density} (T, p)$$

STEAM HEAT

3.2 Steam Heat

Measurements:

A flowmeter measures the actual volume flow in a steam line. A temperature and/or pressure sensor is installed to measure temperature and/or pressure. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- Density, mass flow and heat flow are calculated using the steam tables stored in the flow computer. The heat is defined as the enthalpy of steam under actual conditions with reference to the enthalpy of water at T=0°C.
- With square law device measurement the actual volume is calculated from the differential pressure, taking into account temperature and pressure compensation.
- Saturated steam requires either a pressure or temperature measurement with the other variable calculated using the saturated steam curve.
- Optional steam trap monitoring using compensation input.
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Input Variables:

Superheated Steam: Flow, temperature and pressure

Saturated Steam: Flow, temperature or pressure

Output Results:

- Display Results
Heat, Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Heat, Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4)
- Pulse Output
Heat, Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Heat, Mass or Volume Flow Rate , Total, Pressure, Temperature Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4

Applications:

Monitoring heat flow and total heat of steam. Flow alarms are provided via relays and datalogging is available via analog (4-20mA) and serial outputs.

Steam Heat Illustration

Calculations

Heat Flow

$$\text{Heat Flow} = \text{Volume flow} \cdot \text{density} (T, p) \cdot \text{Sp. Enthalpy of steam} (T, p)$$

NOTE: when using Mass Flowmeter:

$$\text{Heat Flow} = \text{Heat flow} \cdot \text{Mass flow} \cdot \text{Sp. Enthalpy of steam} (T, p)$$

STEAM NET HEAT

3.3 Steam Net Heat

Measurements:

A flowmeter measures the actual volume flow in a steam line. A temperature and a pressure sensor are installed to measure temperature and/or pressure. All measurement are made on the steam side of a heat exchanger. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- Density, mass flow and net heat flow are calculated using the steam tables stored in the flow computer. The net heat is defined as the difference between the heat of the steam and the heat of the condensate. For simplification it is assumed that the condensate (water) has a temperature which corresponds to the temperature of saturated steam at the pressure measured upstream of the heat exchanger.
- With square law device measurement the actual volume is calculated from the differential pressure, taking into account temperature and pressure compensation.
- Saturated steam requires either a pressure or temperature measurement with the other variable calculated using the saturated steam curve.
- Optional steam trap monitoring using compensation input.
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Input Variables:

Superheated Steam: Flow, temperature and pressure
Saturated Steam: Flow, temperature or pressure

Output Results:

- Display Results
 Heat, Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
 Heat, Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4)
- Pulse Output
 Heat, Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
 Heat, Mass or Volume Flow Rate, Total, Pressure, Temperature Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4

Applications:

Monitoring the thermal energy which can be extracted by a heat exchanger taking into account the thermal energy remaining in the returned condensate. For simplification it is assumed that the condensate (water) has a temperature which corresponds to the temperature of saturated steam at the pressure measured upstream of the heat exchanger.

Steam Net Heat Illustration

Calculations

Net Heat Flow

Net Heat Flow = Volume flow • density (T, p) • [E_D (T, p)– E_W (T_{S(p)})]

NOTE: when using Mass Flowmeter:

Heat Flow = Net Heat flow • Mass flow • [E_D (T, p)– E_W (T_{S(p)})]

- E_D = Specific enthalpy of steam
- E_W = Specific enthalpy of water
- T_{S(p)} = Calculated condensation temperature
 (= saturated steam temperature for supply pressure)

STEAM DELTA HEAT

3.4 Steam Delta Heat

Measurements:

Measures the actual flow and pressure of saturated steam (or pressure and temperature if superheated steam) in the supply piping as well as the temperature of the condensate in the condensate piping of the heat exchanger. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- Calculates density, mass flow as well as the delta heat between the saturated steam (supply) and condensation (return) using physical characteristic tables of steam and water stored in the flow computer.
- With square law device measurement the actual volume is calculated from the differential pressure, taking into account temperature and pressure compensation.
- The saturated steam temperature in the supply line is calculated from the pressure measured there if saturated steam is selected.
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Input Variables:

- Supply:* Flow and pressure (saturated steam) or Flow, Pressure, Temperature (super heated steam)
- Return:* Temperature (condensate)

Output Results:

- Display Results
Heat, Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Heat, Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4)
- Pulse Output
Heat, Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Heat, Mass or Volume Flow Rate, Total, Pressure, Temperature Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4

Applications:

Calculate the steam mass flow and the heat extracted by a heat exchanger taking into account the thermal energy remaining in the condensate.

Steam Delta Heat Illustration

NOTE:
For Saturated Steam Case:
 Steam Pressure is measured with Pressure Input on terminal 11
 Condensate Temperature is measured with Temperature Input on Terminal 7

For Superheated Steam Case:
 Steam Pressure is measured with Pressure Input on terminal 11
 Steam Temperature is measured with Temperature Input on Terminal 7
 Condensate Temperature is measured with Auxiliary Input 4 on Terminal 8

Calculations

Delta Heat Flow

Net Heat Flow = Volume flow • density (ρ) • [E_D (ρ)– E_W (T)]

NOTE: when using Mass Flowmeter:
 Net Heat Flow = Mass flow • [E_D (ρ,t)– E_W (T)]

- E_D = Specific enthalpy of steam
- E_W = Specific enthalpy of water

Note: Assumes a closed system.

GAS MASS

3.5 Gas Mass

Measurements:

A flowmeter measures the actual flow in a gas line. Temperature and pressure sensors are installed to measure temperature and pressure. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- Density and mass flow are calculated using gas characteristics stored in the flow computer.
- With square law device measurement the actual volume is calculated from the differential pressure, taking into account temperature and pressure compensation.
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Output Results:

- Display Results
Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4
- Pulse Output
Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Mass or Volume Flow Rate, Total, Pressure, Temperature, Density Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4

Applications:

Monitoring mass flow and total of gas. Flow alarms are provided via relays and datalogging is available via analog (4-20mA) and serial outputs.

Gas Mass Illustration

Calculations

Mass Flow

$$\text{Mass Flow} = \text{Actual Volume Flow} \cdot \rho_{\text{ref}} \cdot \frac{P}{P_{\text{ref}}} \cdot \frac{T_{\text{ref}}}{T} \cdot \frac{Z_{\text{ref}}}{Z}$$

NOTE: when using Mass Flowmeter:

Mass Flow = M

- ρ_{ref} = Reference density
- T_{ref} = Reference temperature
- P_{ref} = Reference pressure
- Z_{ref} = Reference Z-factor
- M = Mass flow

GAS COMBUSTION HEAT

3.6 Gas Combustion Heat

Measurements:

A flowmeter measures the actual volume flow in a gas line. Temperature and pressure sensors are installed to measure temperature and pressure. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- Density, mass flow and combustion heat are calculated using gas characteristics stored in the flow computer.
- With square law device measurement the actual volume is calculated from the differential pressure, taking into account temperature and pressure compensation.
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Output Results:

- Display Results
Heat, Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Heat, Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4
- Pulse Output
Heat, Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Heat, Mass or Volume Flow Rate, Total, Pressure, Temperature Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4

Applications:

Calculate the energy released by combustion of gaseous fuels.

Gas Combustion Heat

Calculations

Combustion Heat Flow

$$\text{Combustion Energy} = C \cdot \rho_{\text{ref}} \cdot Q \cdot \frac{P}{P_{\text{ref}}} \cdot \frac{T_{\text{ref}}}{T} \cdot \frac{Z_{\text{ref}}}{Z}$$

NOTE: when using Mass Flowmeter:

$$\text{Combustion Energy} = C \cdot M$$

- C = Specific combustion heat
- ρ_{ref} = Reference density
- Q = Volume flow
- M = Mass flow

Liquid Mass

3.7 Liquid Mass

Measurements:

Actual volume flow is measured by the flow element (DP transmitter, Flowmeter). Temperature is measured by the temperature transmitter. A pressure transmitter can be used to monitor pressure. Pressure measurement does not affect the calculation. A density transmitter may be used in place of a temperature transmitter for direct density measurement. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- The density and mass flow are calculated using the reference density and the thermal expansion coefficient of the liquid (see "FLUID DATA" submenu)
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Output Results:

- Display Results
Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4
- Pulse Output
Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Mass or Volume Flow Rate, Total, Temperature, Pressure, Density Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4

Applications:

Monitoring mass flow and total of any liquid. Flow alarms are provided via relays and datalogging is available via analog (4-20mA) and serial outputs.

Liquid Mass Illustration

NOTE:

A density transmitter may be used for direct density measurement.

Calculations

Volume Flow

As calculated in section 3.8

Mass Flow

$$\text{Mass Flow} = \text{volume flow} \cdot (1 - \alpha \cdot (T_1 - T_{ref}))^2 \cdot \text{ref. density}$$

$$\alpha = \text{Thermal expansion coefficient} \cdot 10^{-6}$$

LIQUID COMBUSTION HEAT **3.8 Liquid Combustion Heat**

Measurements:

Actual volume flow is measured by the flow element (DP transmitter, Flowmeter). Temperature is measured by the temperature transmitter. A pressure transmitter can be used to monitor pressure. Pressure measurement does not affect the calculation. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- The density, mass flow and combustion heat are calculated using the fluid characteristics stored in the flow computer. (see "FLUID DATA" submenu)
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Output Results:

- Display Results
 Combustion Heat, Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
 Combustion Heat, Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4
- Pulse Output
 Combustion Heat, Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
 Combustion Heat, Mass or Volume Flow Rate, Total, Temperature, Pressure Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4

Applications:

Calculate the energy released by combustion of liquid fuels

Liquid Combustion Heat Illustration

Calculations

Volume Flow

As calculated in section 3.8

Heat Flow

$$\text{Heat Flow} = C \cdot \text{volume flow} \cdot (1 - \alpha \cdot (T_1 - T_{ref}))^2 \cdot \text{ref. density}$$

NOTE: when using Mass Flowmeter:

$$\text{Heat Flow} = C \cdot M$$

- α = Thermal expansion coefficient $\cdot 10^{-6}$
- C = Specific combustion heat
- M = Mass flow

LIQUID SENSIBLE HEAT

3.9 Liquid Sensible Heat

Measurements:

Actual volume flow is measured by the flow element (DP transmitter, Flowmeter). Temperature is measured by the temperature transmitter. A pressure transmitter can be used to monitor pressure. Pressure measurement does not affect the calculation. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- The density, mass flow and sensible heat are calculated using the fluid characteristics stored in the flow computer. (see "FLUID DATA" submenu)
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Output Results:

- Display Results
Sensible Heat, Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature, Pressure, Density, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Sensible Heat, Mass or Volume Flow Rate, Temperature, Pressure, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4
- Pulse Output
Sensible Heat, Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Sensible Heat, Mass or Volume Flow Rate, Total, Temperature, Pressure Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4

Applications:

Calculate the energy stored in a condensate with respect to water at 32°F (0°C).

Liquid Sensible Heat Illustration

Calculations

Volume Flow

As calculated in section 3.8

Heat Flow

$$\text{Heat Flow} = C \cdot \text{volume flow} \cdot (1 - \alpha \cdot (T_1 - T_{\text{ref}}))^2 \cdot \text{ref. density} \cdot (T_1 - 32)$$

NOTE: when using Mass Flowmeter:

$$\text{Heat Flow} = C \cdot M \cdot (T_1 - 32)$$

- α = Thermal expansion coefficient • 10⁻⁶
- C = Specific heat
- M = Mass flow

LIQUID DELTA HEAT

3.10 Liquid Delta Heat

Measurements:

Actual volume flow is measured by the flow element (DP transmitter, Flowmeter). Temperature of the supply and return lines are measured by the temperature transmitters. Measurements are also made on Auxiliary analog inputs 3 and 4, as well as totalization on Auxiliary Pulse Inputs 1,2,3,4.

Calculations:

- The density, mass flow and delta heat are calculated using values of the heat carrying liquid stored in the flow computer. (see "FLUID DATA" submenu)
- If Aux 3 and Aux 4 are both assigned to the same scale (such as PRESSURE psig) the a calculation of Delta P (Aux3-Aux4) is also made and is available for viewing and other informative and assignable uses.

Output Results:

- Display Results
Heat, Mass or Volume Flow Rate, Resettable Total, Non-Resettable Total, Temperature1, Temperature2, Delta Temperature, Density, AUX 3, AUX 4, Delta P (AUX 3 - AUX 4), Auxiliary Totals-1,2,3,4, peak demand, demand last hour, time/date stamp
- Analog Output
Heat, Mass or Volume Flow Rate, Temperature1, Temperature2, Delta Temperature, Density, Peak Demand, Demand Last Hour, AUX 3, AUX 4
- Pulse Output
Heat, Mass or Volume Total, Auxiliary Totals-1,2,3,4
- Relay Outputs
Heat, Mass or Volume Flow Rate, Total, Temperature Alarms, Peak Demand, Demand Last Hour, AUX 3, AUX 4, Auxiliary Totals-1,2,3,4

Applications:

Calculate the energy which is extracted by a heat exchanger from heat carrying liquids.

Liquid Delta Heat Illustration

Calculations

Water

$$\text{Heat} = \text{Volume Flow} \cdot \rho(T1) \cdot [h(T_2) - h(T_1)]$$

$$\text{or Heat} = \text{Mass Flow} \cdot [h(T_2) - h(T_1)]$$

Other heat carrying liquids

$$\text{Heat} = C \cdot \text{volume flow} \cdot (1 - \alpha \cdot (T_1 - T_{ref}))^2 \cdot \rho_{ref} \cdot (T_2 - T_1)$$

$$\text{or Heat} = \text{Mass flow} \cdot C \cdot (T_2 - T_1)$$

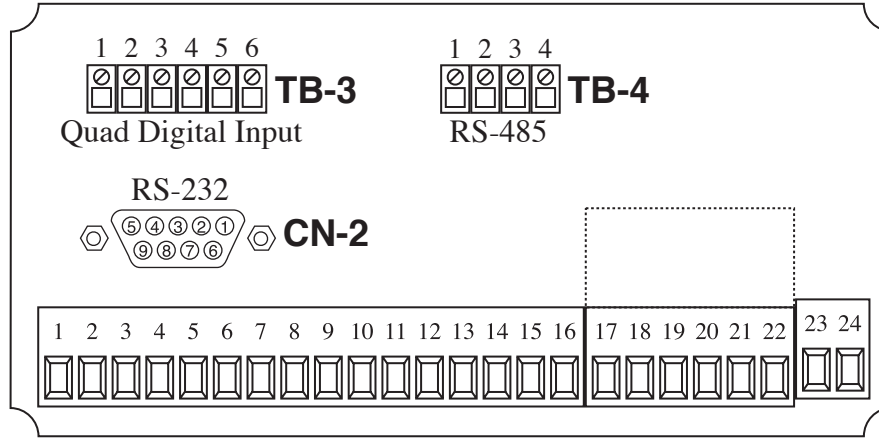

WHERE: Delta T > Low Delta T Cutoff

- α = Thermal expansion coefficient $\cdot 10^{-6}$
- C = Mean specific heat
- $\rho(T1)$ = Density of water at temperature T_1
- $h(T1)$ = Specific enthalpy of water at temperature T_1
- $h(T2)$ = Specific enthalpy of water at temperature T_2
- ρ_{ref} = Reference density
- T_{ref} = Reference temperature

4.3 Typical Wiring:

NOTE 1:
The Pulse Input impedance on the ES-762 has been lowered to 2.7KΩ to work with 4 terminal Vortex flowmeters.

NOTE 2:
For stacked DP use low range DP on terminal 2; high range DP on terminal 3; AUX 3 is not supported.

NOTE 3:
For steam delta heat EQ, when used with super heated steam only, steam temperature on TEMP IN condensate temperature on AUX-4. For saturated steam, condensate temperature on TEMP IN terminals.

4.4 Typical Wiring - Steam Applications:

For use with 2-wire passive transmitters wire as follows:

Input	Connect(+)	Connect(-)
DP Transmitter	terminal 1	terminal 2
Static Pressure	terminal 1	terminal 11
AUX 3	terminal 1	terminal 3
AUX 4	terminal 1	terminal 8
Flowing Temperature	terminal 1	terminal 7

} See NOTE 3 when using Steam Delta Heat EQ.

4.5 Typical Wiring - Chilled Water Applications:

For use with 2-wire passive transmitters wire as follows:

Input	Connect(+)	Connect(-)
DP Transmitter	terminal 1	terminal 2
Return Temperature	terminal 1	terminal 11
AUX 3	terminal 1	terminal 3
AUX 4	terminal 1	terminal 8
Flowing Temperature	terminal 1	terminal 7

5. UNIT OPERATION

5.1 Front Panel Operation Concept for Operate Mode

How To Use On-Line Help

HELP

On-line help is provided to assist the operator in using this product. The help is available during OPERATE and SETUP modes simply by pressing the HELP key. The HELP key is used to enter decimals when entering numeric values.

How To View Process Values

VIEWING PROCESS VALUES

In the OPERATE mode, several keys have a special, direct access feature, to display an item of interest (i.e. RATE, TOTAL, ALARM SETPOINT, etc.). Press the key to view your choice. Press the $\Delta \nabla$ keys to view other items in that group.

How To Clear The Totalizer

CLEARING TOTALIZER

To clear the totalizers, you must press the TOTAL Function Key to select the totalizer group. Press the $\Delta \nabla$ keys to select the desired totalizer. Once the desired totalizer is displayed, press the CLEAR key to reset the total. The operator will be prompted to verify this action and to enter a password if the unit is locked.

How To Clear The Grand Total

CLEARING GRAND TOTAL

To clear the grand totalizers, you must press the GRAND Function Key and use the $\Delta \nabla$ keys to select the desired grand total. Once the grand total is selected, press the CLEAR key to reset the grand total. The operator will be prompted to verify this action and to enter service password if the unit is locked.

How To Enter Alarm Setpoints

ALARM SETPOINT KEYS

ALARM 1 & ALARM 2 keys are used to view and/or change the alarm setpoints. To view the setpoints, simply press the desired Alarm setpoint key once. Rapidly press the alarm setpoint keys several times for direct editing of the alarm setpoints. The operator will be prompted to enter password if the unit is locked. Press CLEAR, "###", ENTER to enter value.

How To Activate The Scrolling Display List

SCROLL

Press the Scroll key to activate the scrolling display list. See section 6 to setup the display list.

How To Use The Print Key

PRINT

The PRINT key is used to print on demand when the communication port is set for printer. When the PRINT key is pressed, a user defined list of data (TOTAL, RATE, ALARM SETPOINT, etc.) is sent to the RS-232 port. A timed message of "PRINTING" will be displayed to acknowledge the print request.

How To Use The Menu Key

MENU KEY

The MENU key is used to view/enter the Instrument Setup and Service Mode. Press the MENU key to access the Setup and Service modes. (See section 6 for Setup mode). The MENU key is also used for a "Pop-Back" function. When the MENU key is pressed, the display will "Pop-Back" to the current submenu heading. Multiple MENU key depressions will return the unit to the Operate Mode.

How To Acknowledge Alarms

ACKNOWLEDGING ALARMS

Most alarm messages are self-clearing. Press the ENTER key to acknowledge and clear latching alarms.

NOTE: Some keys and functions are password protected. Enter the password to gain access. The passwords are factory set as follows:

Private = 1000, Service = 2000

General Operation

5.2 General Operation

This instrument is used primarily to monitor flowrate and accumulated total. The inputs can be software configured for a variety of flowmeter, temperature and pressure sensors. The standard output types include: Pulse, Relay, Analog and RS-232 The unit can display the flowrate, total and process variables. RS-485 is an available option for a second communication channel.

Password Protection

5.3 Password Protection

After an Private and/or Service Code is entered in the "System Parameters" Submenu Group. (see section 6.3, Private Code and Service Code sub-menus), the unit will be locked. The unit will prompt the user for the password when trying to perform the following functions:

- Clear Totals
- Clear Grand Totals (service code required)
- Edit a Setup Menu Item
- Edit Alarm Setpoints (ALARM 1 & ALARM 2 Keys)

The Service Code should be reserved for service technicians. The Service Code will allow access to restricted areas of the Service and Test menus. Changes in these areas may result in lost calibration information.

Relay Operation

5.4 Relay Operation

Two relay alarm outputs are standard. The relays may also be used for pulse outputs. The relays can be assigned to trip according to various rate, total, temperature or pressure readings. The relays can be programmed for low/high alarms, latch or unlatch, or as relay pulse outputs.

ALARM SETPOINT 1 (RLY1) and ALARM SETPOINT 2 (RLY2) are easily accessible by pressing the ALARM 1 or ALARM 2 key on the front panel.

Pulse Output

5.5 Pulse Output

The isolated pulse output is menu assignable to any of the available totals. The pulse output duration and scaling can be set by the user. The pulse output is ideal for connecting to remote totalizers or other devices such as a PLC. See section 1.2 for electrical specifications.

Analog Outputs

5.6 Analog Outputs

The analog outputs are menu assignable to correspond to any of the process parameters. The outputs are menu selectable for 0-20 mA or 4-20 mA. The analog outputs are ideal for "trend" tracking using strip chart recorders or other devices.

Function Keys Display Grouping

5.7 Function Keys; Display Grouping

TOTAL	Press the  keys to view HEAT TOTAL, MASS TOTAL, CORRECTED VOLUME TOTAL, VOLUME TOTAL, AUX TOTALS 1, 2, 3, 4
GRAND TOTAL	Press the  keys to view GRAND HEAT, GRAND MASS, GRAND CORRECTED VOLUME, GRAND VOLUME, AUX TOTALS 1, 2, 3, 4
RATE	Press the  keys to view HEAT, MASS, CORRECTED VOLUME, VOLUME, PEAK DEMAND, DEMAND LAST HOUR
TEMPERATURE	Press the  keys to view TEMPERATURE 1, TEMPERATURE 2, DELTA TEMPERATURE, DENSITY, AUX 3, AUX 4
PRESSURE	Press the  keys to view PRESSURE, DIFFERENTIAL PRESSURE, Y ₁ , SPECIFIC ENTHALPY, AUX 3, AUX 4, AUX 3 - AUX 4
TIME	Press the  keys to view TIME/DATE, PEAK TIME/DATE, ACCUMULATIVE POWER LOSS TIME, TIME OF LAST POWER OUTAGE, TIME POWER WAS LAST RESTORED

**RS-232 Serial Port
Operation**
5.8 RS-232 Serial Port Operation

The RS-232 serial port can be used for programming (using the Setup Disk) or for communicating to printers and computers in the Operating Mode (Run Mode). Enhanced uses include remote metering by modem.

PC Communications
5.8.1 PC Communications:

The Setup Disk also allows the user to query the unit for operating status such as Flow Rate, Flow Total, Temperature, Pressure, Alarm Setpoints, etc. In this mode of operation the RS232 port is assumed connected to a computer. The ST2 will act as a slave and answer requests from the PC. See the Universal Protocol Users Manual for a complete listing of the commands set supported. A DDE/OPC Server is also available for use in exchanging information with DDE Clients such as Spread Sheets, Database Programs, and HMI software.

**RS-232 Serial Port
Operation of RS-232 Serial
Port with Printers**
5.8.2 Operation of RS-232 Serial Port with Printers:
Transaction Printing

For transaction printing, the user defines the items to be included in the printed document (see section 6.13 COMMUNICATION, Print List). The transaction document can be initiated by pressing the PRINT key.

Data Logging

The user can select when (time of day) or how often (print interval) the data log is to be made (see section 6.13 COMMUNICATION, Print Initiate). Information will be stored to the datalogger and optionally output to the RS-232 port.

System Setup and Maintenance Report

The system setup and maintenance report lists all of the instrument setup parameters and usage for the current instrument configuration. The audit trail information and a status report is also printed. This report is initiated in the Service and Analysis Group (see section 6.15 SERVICE & ANALYSIS, Print System Setup).

**Operation of RS-232 Serial
Port with Modems**
5.8.3 Operation of RS-232 Serial Port with Modems
Modem

In this mode of operation the RS232 port is assumed to be connected to KEP's MPP2400N or similar telephone modem. The ST2 is responsible for communicating to a remote computer through the modem to perform such actions as:

Answer incoming calls, process requests for information or action items or data log contents or change setup parameters, call out daily readings to designated phone number, call out to designated phone number in the case of a designated exception or malfunction in the unit, terminating telephone calls if a connection is lost.

**RS-485 Serial Port
Operation**
5.9 RS-485 Serial Port Operation

The RS-485 serial port is intended to permit operation of the flow computer in a RS-485 network. Access is limited to reading process variables, totalizers, error logs and to executing action routines such as clearing totalizers, alarms, and changing setpoints.

**Pause Computations
Prompt**
5.10 Pause Computations Prompt

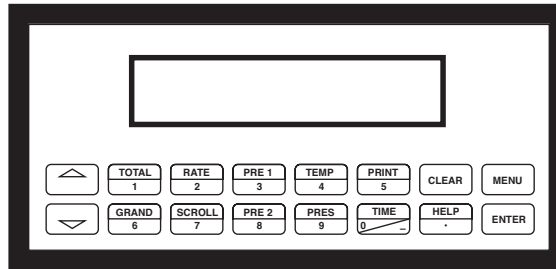

The user will be prompted with a "Pause Computations" message when making significant setup changes to the instrument. Pausing computations is necessary to make any significant changes. With computations paused, all outputs assume a safe state equal to that of an unpowered unit. Computations resume when exiting the setup menu.

6. PROGRAMMING

6.1 Front Panel Operation Concept for Program Mode

The ES762-ST2 is fully programmable through the front panel. The instrument setup menu structure is based on a number of topical submenu groups with one submenu group for each instrument function. Each submenu contains all of the individual settings associated with that function. During the instrument setup, setup topics are shown on the bottom line of the display while the detailed selection options are shown on the top line. A help menu is available for each menu item.

Please review the following key usage summary before attempting to setup the instrument.

CAUTION: When the computations are paused the instrument outputs will go to a safe state which is the same as if the unit lost power. All calculations stop.

Key Usage Summary:

Menu Key

MENU KEY

Pressing the MENU key while in the "HOME" position will select the view setup parameters mode. Thereafter, the MENU key is used to "pop up" one menu level (i.e. return to the start of the submenu group). The unit will "pop up" one level for each time the **MENU key is pressed until finally returning to the "HOME" position of showing the "scroll" display list.**

Up & Down Arrow Keys

UP & DOWN ARROW KEYS

Use the UP and DOWN arrow keys to navigate through the submenu groups. The up and down arrow keys are also used to view the next/previous selection in a selection list within a submenu cell. When entering text characters, the UP and DOWN arrow keys are used to scroll through the available character sets for each individual character location. Press the ENTER key to accept the character and advance to the next character.

Help Key

HELP KEY

On-line help is available to assist the user during instrument setup. A quick help is provided at each setup step. Press the HELP key to display a help message for the current setup selection. This key is also used to enter decimals during numeric entry sequences.

Numeric Entry Keys

NUMERIC ENTRY KEYS

The keys labeled "0 - 9", "-", ".", CLEAR and ENTER are used to enter numerical values. A leading 0 will assume that you intend to enter a minus "-" sign. The standard numeric entry sequence is: CLEAR, "####", ENTER. Numeric entry values are bounded or clamped by minimum and maximum permitted values.

Clear Key

CLEAR KEY

The CLEAR key is used to clear numeric values to "0".

Enter Key

ENTER KEY

The ENTER key is used to accept the current value and advance to the next selection (Successfully terminate the current numeric entry sequence).

**6.2
EZ
SETUP**

EZ SETUP	
EZ SETUP	<p>The EZ Setup routine is a quick and easy way to configure the most commonly used instrument functions. We recommend first completing the EZ Setup routine for the flow equation and meter type for your initial application. The setup can then be customized using the complete submenu groups described later in this chapter.</p> <p>Caution: Entering the EZ Setup mode automatically sets many features to a default value (without prompting the user). This may cause any previously programmed information to be lost or reset.</p> <p>Selection:</p> <p> YES, NO</p> <p>Display: EZ SETUP? YES PAUSE COMPUTATIONS</p> <p>Note: The "Pause Computations" warning message informs the user that all computations are halted while programming EZ Setup.</p> <p>EZ Setup Example: Steam Mass Vortex Flowmeter</p>
UNITS	<p>Select the desired units of measure.</p> <p>Selection:</p> <p> METRIC, ENGLISH</p> <p>Display: ENGLISH UNITS?</p>

The “EZ Setup” routine is completed and the flow computations are resumed.</p>

**6.3
DETAILED
MENU
DESCRIPTION**

DETAILED MENU DESCRIPTION

The menu organization for the unit is depicted in Appendix B. The first depiction is that available with the operator password. The second is that available with supervisor password.

Please reference Appendix B while reviewing the detailed descriptions for each menu location in the following sections.

**6.4
SYSTEM
PARAMETERS****SYSTEM PARAMETERS****EZ SETUP**

The EZ Setup routine is a quick and easy way to configure the most commonly used instrument functions.

Reference:

Refer to Section 6.2 for EZ Setup Programming.

Caution:

Entering the EZ Setup mode automatically sets many features to default values without informing the user. This may cause any previously programmed information to be lost or reset

Selection:

YES, NO

Display: EZ SETUP? NO
 PAUSE COMPUTATIONS

Note:

The "Pause Computations" warning message informs the user that all computations are halted while programming EZ Setup.

ACCESS CODE

This is the menu location where the operator can unlock the unit by entering the correct password (operator or supervisor code), or lock the unit by entering the incorrect password.

Selection:

0 - 9999

Display: 0
 ACCESS CODE

Enter the Viscosity coefficient B for the anticipated fluid. This information is needed by the viscosity computation for UVC and for Reynolds Number calculations.

Note:

Select "SQUARE LAW 16PT" or "LINEAR UVC" in "FLOWMETER TYPE" to activate this function.

Input:

Number with fixed decimal point: 0.000000...1000000

Display:

0.3850
VISCOSITY COEF. B

Computation of Viscosity Coef. A and B

The flow computer solves an equation which computes the viscosity as a function of temperature. Two parameters must be entered for this calculation to be performed. These are the setup parameters Viscosity Coef. A and Viscosity Coef. B. A table listing these values for common fluids is available from KEP.

Alternately, if your intended fluid is not listed, the Viscosity Coef. A and B can be derived from two known temperature/viscosity pairs. Begin by obtaining this information for you intended fluid. Convert these known points to units of Degrees F and centipoise (cP)

The information is now in a suitable form to compute the Viscosity Coef. A and Viscosity Coef. B using the following equation based on the fluid state.

For a liquid, A and B are computed as follows:

$$B = \frac{(T1 + 459.67) \cdot (T2 + 459.67) \cdot \ln [cP1/cP2]}{(T2 + 459.67) - (T1 + 459.67)}$$

$$A = \frac{cP1}{\exp [B / (T1 + 459.67)]}$$

For a gas, A and B are computed as follows:

$$B = \frac{\ln [cP2 / cP1]}{\ln [(T2 + 459.67) / (T1 + 459.67)]}$$

$$A = \frac{cP1}{(T1 + 459.67)^B}$$

NOTE: $cS = \frac{cP}{\text{Density (in kg/l)}}$

% RELATIVE HUMIDITY

Enter the % Relative Humidity in the anticipated gas mixture. This information is needed to more accurately compute the density of a Humid gas.

FLOWMETER TYPE	<p>Select the flowmeter type. The flow equation (see SYSTEM PARAMETERS) and the flowmeter selected here determine the basic operation of the flow computer.</p> <p>Selection:</p>	
LINEAR		Volumetric flowmeter with linear pulse or analog output.
SQR LAW		Differential pressure transmitter without square root extraction, with analog output.
SQR LAW-LIN.		Differential pressure transmitter with square root extraction and analog output.
LINEAR 16 PT*		Volumetric flowmeter with nonlinear pulse or analog output; with 16 point linearization table.
SQR LAW 16 PT*		Differential pressure transmitter without square root extraction, with analog output and 16 point linearization table.
SQR LAW-LIN. 16 PT*		Differential pressure transmitter with square root extraction, analog output and 16 point linearization table.
LINEAR UVC		Volumetric Turbine flowmeter with UVC calibration curve documentation and pulse output.
LINEAR MANIFOLD		Linear manifold consists of 2 linear flowmeters used in conjunction with an external bypass/diverter valve. It may be used with turbine, PD, Mag, Vortex flowmeters equipped with analog outputs to extend the allowable turndown range.
GILFLO		Gilflo flowmeters are special purpose differential pressure type flowmeters with an analog output where the differential pressure is linear with flow.
GILFLO 16PT		Gilflo 16 PT flowmeters are special purpose differential pressure type flowmeters with an analog output where the differential pressure is approximately linear with flow, but can be further enhanced by a 16 point linearization table.
BYPASS		BYPASS is a selection for use with Bypass(Shuntflow) flowmeters equipped with a pulse output.
ILVA 16PT		ILVA 16 PT flowmeters are special purpose differential pressure type flowmeters with an analog output where the differential pressure is approximately linear with flow, but can be further enhanced by a 16 point linearization table.
MASS FLOW METER		Flowmeter type such as Coriolis, or Thermal Flowmeter whose output is directly proportional to mass flow. Multivariable transmitters whose output is proportional to a computed mass flow rate can also use this meter type selection.
		* A linearization table must be entered by user. (see "LINEARIZATION" submenu).

FLOW INPUT
(Continued)**

FLOW INPUT

METER EXP. COEF.

The flowmeter pipe expands depending on the temperature of the fluid. This affects the calibration of the flowmeter. This submenu allows the user to enter an appropriate correction factor. This is given by the manufacturer of the flowmeter. This factor converts the changes in the measuring signal per degree variation from calibration temperature. The calibration temperature is entered into the flow computer to 70 F / 21 °C.

Some manufacturers use a graph or a formula to show the influence of temperature on the calibration of the flowmeter. In this case use the following equation to calculate the meter expansion coefficient:

$$K_{me} = \frac{1 - \frac{Q(T)}{Q(T_{CAL})}}{T - T_{CAL}} \cdot 1,000,000$$

- K_{ME} Meter expansion coefficient
- $Q(T)$ Volumetric flow at temperature T resp. T_{CAL}
- T Average process temperature
- T_{CAL} Calibration temperature

Note:

- This correction should be set in either the flowmeter or in the flow computer.
- Entering the value "0.000" disables this function
- Value can be calculated from Fa factor

Input:

Number with floating decimal point:
0.000...999.9 (e-6/°X)

Display:

27.111 (E-6/°F)
METER EXP. COEF.

FLOW INPUT
(Continued)**

FLOW INPUT

DP FACTOR

The DP-Factor describes the relationship between the flowrate and the measured differential pressure. The flowrate is computed according to one of the three following equations, depending on the selected flow equation:

Steam (or gas) mass flow:

$$M = \frac{K_{DP} \cdot \varepsilon_1 \cdot \sqrt{2 \cdot \Delta p \cdot \rho}}{1 - K_{ME} \cdot (T - T_{CAL})}$$

Liquid volume flow:

$$Q = \frac{K_{DP} \cdot \sqrt{(2 \cdot \Delta p) / \rho}}{(1 - K_{ME} \cdot (T - T_{CAL}))}$$

Gas corrected volume flow:

$$Q_{REF} = \frac{K_{DP} \cdot \varepsilon_1 \cdot \sqrt{2 \cdot \Delta p \cdot \rho}}{\rho_{REF} \cdot (1 - K_{ME} \cdot (T - T_{CAL}))}$$

- M Mass flow
- Q Volumetric flow
- Q_{REF} Corrected volumetric flow
- K_{DP} DP-Factor
- ε₁ Gas expansion factor (Y₁)
- T Operating temperature
- T_{CAL} Calibration temperature
- Δp Differential pressure
- ρ Density at flowing conditions
- K_{ME} Meter expansion coefficient x 10⁻⁶
- ρ_{REF} Reference density

COMPUTE FACTOR? YES

If "NO": Enter DP FACTOR

If "YES": You will be prompted for the following:

ENTER DELTA P
ENTER FLOWRATE
ENTER DENSITY
ENTER TEMPERATURE
ENTER INLET PRESSURE
ENTER ISENTROPIC EXP

6.8
FLOW INPUT
(Continued)

FLOW INPUT

DP FACTOR
(Continued)

The flow computer will then compute the gas expansion factor (ϵ_1), (Y_1) using one of the following equation:

Orifice Case:

$$Y_1 = \epsilon_1 = 1 - \left[(0.41 + 0.35 \beta^4) \cdot \frac{\Delta p}{\kappa \cdot p_1 \cdot 27.7} \right]$$

V-Cone, Venturi, Flow Nozzle, Wedge Case:

$$R = 1 - \frac{\Delta p}{27.7 \cdot p_1}$$

$$Y_1 = \epsilon_1 = \sqrt{\frac{(1 - \beta^4) \cdot \frac{\kappa}{\kappa - 1} \cdot R^{2/\kappa} \cdot (1 - R^{(\kappa-1)/\kappa})}{[(1 - (\beta^4 \cdot R^{2/\kappa})) \cdot (1 - R)]}}$$

Annubar, Pitot, Target Case;

$$Y_1 = \epsilon_1 = 1.0$$

- ϵ_1 Gas expansion factor
- β BETA (geometric ratio)
- Δp Differential pressure
- κ Isentropic exponent
- p_1 Inlet pressure (absolute)

NOTE: 27.7 is a units conversion constant from the absolute inlet pressure units to the differential pressure units. (27.7 is for psia to "H2O, use other units conversions as required.).

FLOW INPUT

**DP FACTOR
(Continued)**

Verabar Case

$$Y_v = 1 + (18093 - .4191(1 - \beta)^2) \cdot \left(\frac{h_w}{27.73 \cdot P_{fa} \cdot \Gamma} \right)$$

Where:

$$\beta = \text{The sensor blockage} = \frac{4 \cdot P_w}{\pi \cdot D}$$

$$\pi = 3.14159$$

D = Internal pipe diameter in inches.

P_w = The sensor's probe width in inches.

$P_w = 0.336''$ for a -05 sensor.

$P_w = 0.614''$ for a -10 sensor.

$P_w = 1.043''$ for a -15 sensor.

h_w = Verabar differential pressure in inches of H₂O.

P_{fa} = Absolute static pressure (high side of the Verabar) in psia.

$\Gamma = k$ = Isentropic exponent for a real gas or steam.

Accelabar Case

See equations on page 93

**6.8
FLOW INPUT
(Continued)**

FLOW INPUT

**DP FACTOR
(Continued)**

The DP-Factor (K_{DP}) is then computed using one of the following equations:

Steam:

$$K_{DP} = \frac{M \cdot (1 - K_{ME} \cdot (T - T_{CAL}))}{\epsilon_1 \cdot \sqrt{2 \cdot \Delta p} \cdot \rho}$$

Liquid:

$$K_{DP} = \frac{Q \cdot (1 - K_{ME} \cdot (T - T_{CAL}))}{\sqrt{\frac{2 \cdot \Delta p}{\rho}}}$$

Gas:

$$K_{DP} = \frac{Q_{REF} \cdot \rho_{REF} \cdot (1 - K_{ME} \cdot (T - T_{CAL}))}{\epsilon_1 \cdot \sqrt{2 \cdot \Delta p} \cdot \rho}$$

- K_{DP} DP-Factor
- M Mass flow
- Q Volumetric flow
- Q_{REF} Corrected volumetric flow
- ϵ_1 Gas expansion factor
- T Operating temperature
- T_{CAL} Calibration temperature
- Δp Differential pressure
- ρ Density at flowing conditions
- ρ_{REF} Reference density

Note:

The computation accuracy can be enhanced by entering up to 16 values for Reynold's Number DP-Factor in a linearization table (see "LINEARIZATION"). Each DP-Factor can be calculated using the above procedure. For every calculation, a sizing sheet is required. The results have to be entered in the linearization table afterwards.

**LOW PASS
FILTER**

Enter the maximum possible frequency of a flowmeter with a digital output. Using the value entered here, the flow computer selects a suitable limiting frequency for low pass filter to help suppress interference from higher frequency signals.

Input:

Max. 5 digit number: 10...40000 (Hz):

Display:

40000 Hz
LOW PASS FILTER

**6.8
FLOW INPUT
(Continued)**

FLOW INPUT

LINEARIZATION

With many flowmeters, the relationship between the flowrate and the output signal may deviate from an ideal curve (linear or squared). The flow computer is able to compensate for this documented deviation using a linearization table. The appearance of the linearization table will vary depending on particular flowmeter selected.

Linear flowmeters with pulse output

The linearization table enables up to 16 different frequency & K-factor pairs. The frequency and corresponding K-factor are prompted for each pair of values. Pairs are entered in ascending order by frequency.

Linear Flowmeters with pulse outputs and a UVC Curve:

The linearization table enables up to 16 different Hz/cstks and K-Factor points. The Hz/cstks and corresponding K-Factors are prompted for each pair of values. Pairs are entered in ascending order by Hz/cstks.

Linear flowmeters with analog output (excluding Gilflo, ILVA)

The linearization table enables up to 16 different flowrate & correction factor pairs. The flowrate and corresponding correction factor are prompted for each pair of values. The correction factor (C_f) is determined as follows.

$$C_f = \frac{\text{actual flowrate}}{\text{displayed flowrate}}$$

Linear/squared DP transmitters with analog output

The linearization table enables up to 16 different Reynold's Number an DP factor pairs. The Reynold's Number and corresponding DP factor are prompted for each pair of values.

Selection:

CHANGE TABLE? NO
CHANGE TABLE? YES

If "YES" the linearization table sequence of prompts will begin.

Example (for linear flowmeters with analog output)

Enter flow rate:
FLOW ft³/h 3.60
POINT 0

Entry of corresponding correction factor:
COR.FACTOR 1.0000
POINT 0

Note:

Enter "0" for the value of a pair (other than point 0) to exit the linearization table routine and use the values stored up to that point.

The flow computer is fully operational during simulation. • Simulation mode is ended immediately after exiting this submenu. <p>Selection:</p> <div style="display: flex; align-items: center;">  <div style="margin-left: 10px;">OFF, 0 mA, 2 mA, 4 mA, 12 mA, 20 mA, 25 mA</div> </div> <p>Display:</p> <div style="text-align: right; margin-right: 50px;">OFF</div> <p style="text-align: center;">SIMULATION CURRENT</p>

6.12
RELAYS

RELAYS	
SELECT RELAY	<p>Set relay output to be configured. Two or three relay outputs are available.</p> <p>Selection:</p> <div style="display: flex; align-items: center; gap: 10px;">  <div style="margin-left: 10px;"> <p>1 (Relay 1)</p> <p>2 (Relay 2)</p> </div> </div> <p>Display: 1</p> <p style="text-align: center;">SELECT RELAY</p>
RELAY FUNCTION	<p>Both relays (1 and 2, and optional 3rd relay) can be assigned to various functions as required:</p> <p>Alarm functions Relays activate upon exceeding limit setpoints. Freely assignable to measured or calculated variables or totalizers.</p> <p>Malfunction Indication of instrument failure, power loss, etc.</p> <p>Pulse output The relays can be defined as additional pulse outputs for totalizer values such as heat, mass, volume or corrected volume.</p> <p>Wet steam alarm The flow computer can monitor pressure and temperature in superheated steam applications continuously and compare them to the saturated steam curve. When the degree of superheat (distance to the saturated steam curve) drops below 5 °C, the relay switches and the message "WET STEAM ALARM" is displayed.</p> <p>NOTE: Relay response time is affected by the value entered for display damping. The larger the display damping value, the slower the relay response time will be. This is intended to prevent false triggering of the relays. Enter a display damping factor of zero (0) for fastest relay response time.</p> <p>Selection: Different selections are available depending on the flow equation and type of transmitter selected.</p> <div style="display: flex; align-items: flex-start; gap: 10px; margin-top: 10px;">  <div style="margin-left: 10px;"> <p>HEAT TOTAL, MASS TOTAL, ACTUAL VOLUME TOTAL, HEAT FLOW, MASS FLOW, COR. VOL. FLOW, AUX TOTAL 1, 2, 3, 4 VOLUME FLOW, TEMPERATURE 2, DELTA TEMPERATURE, PRESSURE, DENSITY, WET STEAM ALARM, MALFUNCTION, PEAK DEMAND, DEMAND LAST HOUR, AUX 3, AUX 4, AUX 3-4</p> </div> </div> <p>Display: VOLUME FLOW</p> <p style="text-align: center;">RELAY FUNCTION</p>

**6.12
RELAYS
(Continued)**

RELAYS	
RELAY MODE	<p>Set when and how the relays are switched "ON" and "OFF". This defines both the alarm conditions and the time response of the alarm status.</p> <p>Selection:</p> <p> HI ALARM, FOLLOW LO ALARM, FOLLOW HI ALARM LATCH LO ALARM LATCH RELAY PULSE OUTPUT</p> <p>Note:</p> <ul style="list-style-type: none"> For relay functions "MALFUNCTION" and "WET STEAM ALARM". There is no difference between the modes "HI....." and "LO.....": (i.e. HI ALARM FOLLOW = LO ALARM FOLLOW, HI ALARM LATCH = LOW ALARM LATCH) Relay mode "RELAY PULSE OUTPUT" defines the relay as an additional pulse output. <p>Display: HI ALARM, FOLLOW RELAY MODE</p>
LIMIT SETPOINT	<p>After configuring a relay for "Alarm indication" (limit value), the required setpoint can be set in this submenu. If the variable reaches the set value, the relay switches and the corresponding message is displayed. Continuous switching near the setpoint can be prevented with the "HYSTERESIS" setting.</p> <p>Note:</p> <ul style="list-style-type: none"> Be sure to select the units (SYSTEM UNITS) before entering the setpoint in this submenu. Normally open or normally closed contacts are determined when wiring. <p>Input:</p> <p> Number with floating decimal point: -999999...+999999</p> <p>Display: 99999.0 ft³/h LIMIT SETPOINT 1</p>

**6.12
RELAYS
(Continued)**

RELAYS	
PULSE VALUE	<p>Define the flow quantity per output pulse if the relay is configured for "RELAY PULSE OUTPUT".. This is expressed in units per pulse (i.e. ft³ / pulse).</p> <p>Note: Ensure that the max. flowrate (full scale value) and the pulse value entered here agree with one another. The max. possible output frequency is 5Hz. The appropriate pulse value can be determined as follows:</p> $\text{Pulse value} > \frac{\text{estimated max. flowrate (full scale)/sec}}{\text{required max. output frequency}}$ <p>Input:</p>  <p>Number with floating decimal point: 0.001...1000.0</p> <p>Display: 1.000 ft³/P PULSE VALUE</p>
PULSE WIDTH	<p>Enter the pulse width. Two cases are possible:</p> <p>Case A: Relay set for "MALFUNCTION" or limit value The response of the relay during alarm status is determined by selecting the pulse width.</p> <ul style="list-style-type: none"> • Pulse width = 0.0 s (Normal setting) Relay is latched during alarm conditions. • Pulse width = 0.1...9.9 s (special setting) Relay will energize for selected duration, independent of the cause of the alarm. This setting is only used in special cases (i.e. for activating signal horns). <p>Case B: Relay set for "RELAY PULSE OUTPUT" Set the pulse width required for the external device. The value entered here can be made to agree with the actual flow amount and pulse value by using the following:</p> $\text{Pulse width} < \frac{1}{2 \cdot \text{max. output frequency (Hz)}}$ <p>Input:</p>  <p>Number with floating decimal point: 0.01...9.99 s (pulse output) 0.00...9.99 s (all other configurations)</p> <p>Display: .01 s PULSE WIDTH</p>

**6.12
RELAYS
(Continued)**

RELAYS	
HYSTERESIS	<p>Enter a hysteresis value to ensure that the "ON" and "OFF" switchpoints have different values and therefore prevent continual and undesired switching near the limit value.</p> <p>Input:</p> <div style="display: flex; align-items: center; margin-bottom: 10px;">  <p>Number with floating decimal point: 0.000...999999</p> </div> <p>Display: 0.000 psia HYSTERESIS</p>
RESET ALARM	<p>The alarm status for the particular relay can be cancelled here if (for safety reasons) the setting "....., LATCH" has been selected in the submenu "RELAY MODE". This ensures that the user is actively aware of the alarm message.</p> <p>Note:</p> <ul style="list-style-type: none"> • When in the HOME position, press the ENTER key to acknowledge and clear alarms. • The alarm status can only be permanently cancelled if the cause of the alarm is removed. <p>Selection:</p> <div style="display: flex; align-items: center; margin-bottom: 10px;">  <p>RESET ALARM? NO RESET ALARM? YES</p> </div> <p>Display: RESET? NO RESET ALARM</p>
SIMULATE RELAY	<p>As an aid during start-up, the relay output may be manually controlled independent of it's normal function.</p> <p>Selection:</p> <div style="display: flex; align-items: center; margin-bottom: 10px;">  <p>NORMAL, ON, OFF</p> </div> <p>Display: NORMAL SIMULATE RELAY</p>

7. Principle Of Operation

General Operation

7.1 General:

The ES762-ST2 Flow Computer uses several internal calculations to compute the compensated flow based on specific data input. Several computations are performed to arrive at the uncompensated flow, temperature, pressure, density and viscosity. This information is then used to compute the Mass Flow or Heat Flow.

7.2 Square Law Flowmeter Considerations:

Square Law Flowmeter Considerations

Head class flowmeters are supplied by the manufacturers with a 4-20 mA output span which is already in flow units. The ES762-ST2 permits the user to enter this flowmeter information directly. However, closely associated with this information is the density that was assumed during flowmeter calibration. This information must also be input if the user is to obtain maximum accuracy.

It is assumed that the user has the printout from a standardized sizing program for the particular device he will be using. Such standardized printouts list all the necessary information which the user will then be prompted for.

Several specialized flow equations are listed that are not intended for the standard unit but to be offered to appropriate OEMs or as special order items. These are designated by a “†”.

Note concerning Fluid Information

The user will be prompted for Fluid Information during the setup of the instrument. See Appendix A for the properties of several common fluids.

Flow Equations

7.3 Flow Equations:

7.3.1 Flow Input Computation

Flow Input Computation:

Linear

$$\text{Input Flow} = [\% \text{ input span} \cdot (\text{flow FS} - \text{flow low scale})] + \text{flow low scale}$$

Square Law without External SQRT Extractor

$$\text{delta P} = [(\% \text{ input span}) \cdot (\text{flow FS} - \text{flow low scale})] + \text{flow low scale}$$

Square Law with External SQRT Extractor

$$\text{delta P} = [(\% \text{ input span})^2 \cdot (\text{flow FS} - \text{flow low scale})] + \text{flow low scale}$$

NOTE: For stacked differential pressure option, the appropriate input sensor signal is used in calculations at all times to maximize accuracy.

7.3.2
Pressure
Computation

Pressure Input:

General Case

$$P_f = [\% \text{ input span} \cdot (\text{Pres full scale} - \text{Pres low scale})] + \text{Pres low scale}$$

Gauge Case

$$P_f = P_f + \text{Barometric}$$

Manual Case or In Event of Fault

$$P_f = \text{Pressure Default Value}$$

7.3.3
Temperature
Computation

Temperature Computation:

General Case

$$T_f = [\% \text{ input span} \cdot (\text{Temp full scale} - \text{Temp low scale})] + \text{Temp low scale}$$

RTD Case

$$T_f = f(\text{measured input resistance})$$

Manual Case or In Event of Fault

$$T_f = \text{Temperature Default Value}$$

Delta Temp Case

$$\begin{aligned} \text{Delta Temp} &= T_2 - T_1 && \text{Flowmeter location} = \text{cold} \\ \text{Delta Temp} &= T_1 - T_2 && \text{Flowmeter location} = \text{hot} \end{aligned}$$

7.3.4
Density/Viscosity
Computation

Density Computation:

Water Case

$$\text{density_water} = \text{density}(T_f)$$

Liquid Case

$$\text{density} = \text{reference density} \cdot (1 - \text{Therm.Exp.Coeff.} \cdot (T_f - T_{\text{ref}}))^2$$

Steam Case

$$\text{density} = 1 / \text{specific volume}(T_f, P_f)$$

Gas Case

$$\text{density} = \text{reference density} \cdot \frac{P_f}{P_{\text{ref}}} \cdot \frac{(T_{\text{ref}} + 273.15)}{(T_f + 273.15)} \cdot \frac{Z_{\text{ref}}}{Z_f}$$

NOTE: Therm.Exp.Coeff is ($\times 10^{-6}$)

7.3.4
Density/Viscosity
Computation
 (continued)

Viscosity (cP) Computation:

Liquid Case

$$\text{cP viscosity} = A \cdot \exp \frac{B}{(T_f + 459.67)}$$

NOTE:

$$\text{Viscosity cS} = \frac{\text{viscosity (in cP)}}{\left(\frac{\text{flowing density}}{\text{density of water @ 4°C}} \right)}$$

Gas Case

$$\text{cP viscosity} = A \cdot (T_f + 459.67)^B$$

Steam Case

$$\text{cP viscosity} = f(T_f, P_f)$$

7.3.5
Mass Flow
Computation

Mass Flow Computations:

$$\text{mass flow} = \text{volume flow} \cdot \text{density}$$

7.3.6
Comb. Heat Flow
Computation

Combustion Heat Flow Computations:

$$\text{combustion heat flow} = \text{mass flow} \cdot \text{combustion heating value}$$

**7.3.7
Heat Flow
Computation**

Heat Flow Computation:

Steam Heat

$$\text{heat flow} = \text{mass flow} \cdot \text{total heat steam}(T_f, P_f)$$

Steam Net Heat

$$\text{heat flow} = \text{mass flow} \cdot [\text{total heat steam}(T_f, P_f) - \text{heat saturated water}(P_f)]$$

Steam Delta Heat

$$\text{heat flow} = \text{mass flow} \cdot [\text{total heat saturated steam}(P_f) - \text{heat water}(T_f)]$$

**7.3.8
Sensible Heat Flow
Computation**

Sensible Heat Flow:

Special Case for Water

$$\text{heat flow} = \text{mass flow}(T_f) \cdot \text{enthalpy}(T_f)$$

**7.3.9
Liquid Delta Heat
Computation**

Liquid Delta Heat:

General Case

$$\text{heat flow} = \text{mass flow} \cdot \text{specific heat} \cdot (T_2 - T_f)$$

Water Case

$$\text{heat flow} = \text{mass flow}(T_f) \cdot [\text{enthalpy}(T_2) - \text{enthalpy}(T_f)]$$

**7.3.10
Expansion Factor
Computation
for Square Law
Flowmeters**

Expansion Factor Computation for Square Law Flowmeters:

In the following Equations, delta P is assumed in ("H₂O), Pf is in PSIA, 27.7 is a PSIA to ("H₂O) units conversion.

Liquid Case

$$Y = 1.0$$

Gas, Steam Case

Orifice Case

$$Y = 1.0 - (0.41 + 0.35 \cdot B^4) \cdot \frac{\text{delta P}}{\text{isentropic exponent} \cdot P_f \cdot 27.7}$$

V-Cone, Venturi, Flow Nozzle, Wedge Case:

$$R = 1 - \frac{\Delta p}{27.7 \cdot p_f}$$

$$Y = \sqrt{\frac{(1 - \beta^4) \cdot \frac{\kappa}{\kappa - 1} \cdot R^{2/\kappa} \cdot (1 - R^{(\kappa-1)/\kappa})}{[(1 - (\beta^4 \cdot R^{2/\kappa})) \cdot (1 - R)]}}$$

NOTE: An equivalent formula is used by V-Cone flowmeter types.
Target, Annubar, Pitot Case:

$$Y = 1.0$$

7.3.10
Expansion Factor
Computation for
Square Law
Flowmeters
(continued)

Verabar Case

$$Y_v = 1 + \left(18093 - .4191(1 - \beta)^2 \right) \cdot \left(\frac{h_w}{27.73 \cdot P_{fa} \cdot \Gamma} \right)$$

Where:

$$\beta = \text{The sensor blockage} = \frac{4 \cdot P_w}{\pi \cdot D}$$

$$\pi = 3.14159$$

D = Internal pipe diameter in inches.

P_w = The sensor's probe width in inches.

$P_w = 0.336"$ for a -05 sensor.

$P_w = 0.614"$ for a -10 sensor.

$P_w = 1.043"$ for a -15 sensor.

h_w = Verabar differential pressure in inches of H₂O.

P_{fa} = Absolute static pressure (high side of the Verabar) in psia.

$\Gamma = k$ = Isentropic exponent for a real gas or steam.

**7.3.10
Expansion Factor
Computation for
Square Law
Flowmeters
(continued)**

Accelabar Case

For 1 inch Accelabar Body

$$Y_a = .9824 - .5890 \cdot \left(\frac{h_w}{27.73 \cdot P_{fta} \cdot \gamma} \right)$$

For 2 inch Accelabar Body

$$Y_a = .9730 - \left(.5850 \cdot \left(\frac{h_w}{27.73 \cdot P_{fta} \cdot \gamma} \right) \right)$$

Where:

- Y_a = Accelabar gas expansion factor (dimensionless)
- h_w = Differential pressure (inches H₂O @ 68°F)
- P_{fta} = Flowing Pressure in Accelabar Throat (psia)
= Flowing pressure in psig + atmospheric pressure in psi
- γ = Isentropic Exponent for a real gas

For 3 inch to 12 inch Accelabar Body

$$Y_a = 1 - Y_{a-coef} \cdot \left(\frac{h_w}{27.73 \cdot P_{fta} \cdot \Gamma} \right)$$

Where:

- Y_a = General Accelabar gas expansion factor (dimensionless)
- Y_{a-coef} = Accelabar gas expansion factor coefficient (dimensionless)
- h_w = Differential pressure (inches H₂O @ 68°F)
- P_{fta} = Flowing Accelerator Throat Pressure (psia)
= Flowing throat pressure in psig + atmospheric pressure in psi
- Γ = Isentropic Exponent for a real gas or steam

Accelabar Size	Y_{a-coef}
3"	0.7432
4"	0.6986
6"	0.6865
8"	0.6407
10"	0.6095
12"	0.5891

7.3.11
Uncompensated Flow
Computation

Uncompensated Flow Computation:

Pulse, Linear Case

$$\text{volume flow} = \frac{\text{input frequency} \cdot \text{Time Scaling Factor}}{\text{K-Factor} \cdot [1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}$$

Analog, Linear Case

$$\text{volume flow} = \frac{\text{Measured Input Flow}}{[1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}$$

Square Law Case

$$\text{volume flow} = \frac{\text{DP Factor}}{[1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]} \cdot Y \cdot \left[\frac{2 \cdot \text{delta P}}{\text{density}} \right]^{1/2}$$

Square Law, Target Flowmeter Case

$$\text{volume flow} = \text{input flow} \cdot \frac{\sqrt{\text{density cal.}}}{\sqrt{\text{density flowing}}}$$

Pulse, Linearization Case

$$\text{volume flow} = \frac{\text{input frequency} \cdot \text{Time Scaling Factor}}{\text{K-Factor(Hz)} \cdot [1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}$$

Analog, Linearization Case

$$\text{volume flow} = \frac{\text{Input Flow} \cdot \text{Correction Factor (Input Flow)}}{[1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}$$

Square Law, Linearization Case

$$\text{volume flow} = \frac{\text{DP Factor(RN)}}{[1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]} \cdot Y \cdot \left[\frac{2 \cdot \text{delta P}}{\text{density}} \right]^{1/2}$$

Pulse, UVC Case

$$\text{volume flow} = \frac{\text{input frequency} \cdot \text{Time Scaling Factor}}{\text{K-Factor (Hz/cstks)} \cdot [1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}$$

Shunt Flow Bypass Flowmeter

$$\text{volume flow} = \frac{\text{input frequency} \cdot 457 \cdot \text{Epa} \cdot Y_m}{\sqrt{\text{flowing density}} \cdot \text{DC} \cdot \text{bypass calibration favior}}$$

Gilflo Flowmeter

$$\text{volume flow at flowing conditions} = \text{input flow at design conditions} \cdot \sqrt{\frac{\text{calibration density}}{\text{flowing density}}}$$

NOTE: Therm.Exp.Coef is 10⁻⁶

**7.3.12
ILVA Flow Meter
Equations**

ILVA Flowmeter - This meter type requires an initial linearization using the linearization table. In addition, the following specialized corrections are required.

For Gas/Steam Expansion (imperial) **$Y = 1 - (115.814 \cdot (dp / p) \cdot 0.0001)$**

Where: Y = gas expansion correction (NOTE: Y=1 for liquid)
 dp = differential pressure - inches water gauge
 p = upstream pressure - psia

For Reynolds Number (volumetric calculations for Gas/Steam)

**$Cre = (1 - (n / Qn))^{-1}$
to a maximum value of m**

Where: Cre = Reynolds number correction (NOTE Cre = 1 for liquid)
 Qn = nominal water volumetric flowrate (column 6)
 m = (see table below)
 n = (see table below)

Meter Size	n	m
DN50	2.53	1.200
DN80	0.64	1.125
DN100	0.21	1.100
DN150	0.13	1.067
DN200	0.07	1.050

The final gas expansion and Reynolds number correction is: **$Qc = Qn \cdot Y \cdot Cre$**

For Volumetric Calculations: (calculate the density corrected volumetric flowrate):

$Qd = Qc \cdot (Dn / Da)^{0.5}$

Where: Qd = density corrected volumetric flowrate
 Qc = nominal water volumetric flowrate (column 6) corrected for
 Reynolds Number and gas expansion effects.
 Da = actual flowing density of working fluid
 Dn = nominal density of water at reference conditions

Once corrected for density a further correction is required to take into account the effect of temperature on the ILVA primary element.

Temperature Compensation

For Volumetric Calculations: Using the value of Qd derived above, the temperature corrected flowrate can be calculated: **$Qa = ((Ta - Tref) \cdot 0.000189 \cdot Qd) + Qd$**

Where: Qa = actual volumetric flowrate
 Qd = density corrected volumetric flowrate (from above)
 Tref = reference temperature in °C (generally 20°C)
 Ta = actual flowing temperature of working fluid (in °C)

It is possible to convert from a mass flowrate to a volumetric flowrate and vice versa using the following simple formula: **$Ma = Qn \cdot Da$**

Where: Da = actual flowing density of working fluid

7.4 Computation of the DP Factor

It is assumed that the user has the printout from a standardized sizing program for the particular device he will be using. Such standardized printouts list all the necessary information which the user will then be prompted for by the instrument or diskette.

It is also important that the user select the flow equation to be used and either select or enter the following items:

- Flowmeter Type
- The fluid type or the fluid properties applicable to the fluid to be measured
- Beta, Meter Exp. Coeff., Inlet Pipe Bore
- Reference Conditions of temperature, pressure, Z and calibration temperature

The user is prompted for the following:

- mass flow or volume flow or corrected volume flow as indicated by the flow equation
- Differential Pressure
- Inlet Pressure
- Temperature
- Density
- Isentropic Exponent

The unit then computes the following results corresponding to the user entry conditions and appropriate methods:

Y

Finally the DP Factor is computed as follows:

Steam Case

$$\text{DP Factor} = \frac{\text{mass flow} \cdot [1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}{Y \cdot [2 \cdot \text{delta P} \cdot \text{density}]^{1/2}}$$

Liquid Case

$$\text{DP Factor} = \frac{\text{volume} \cdot [1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}{\left[\frac{2 \cdot \text{delta P}}{\text{density}} \right]^{1/2}}$$

Gas Case

$$\text{DP Factor} = \frac{\text{Std.Vol.Flow} \cdot \text{ref density} \cdot [1 - \text{Meter Exp.Coeff.} \cdot (T_f - T_{cal})]}{Y \cdot [2 \cdot \text{delta P} \cdot \text{density}]^{1/2}}$$

Application Hint:

The user may reenter this DP Factor multiple times to assist him in assembling the table points of DP Factor and Reynold's Number necessary to construct a 16 point table for the meter run.

NOTE: Meter Exp.Coeff is (x10⁻⁶)

8. RS-232 Serial Port

8.1 RS-232 Port Description:

The ES762-ST2 has a general purpose RS-232 Port which may be used for any one of the following purposes:

Transaction Printing, Data Logging, Remote Metering by Modem, Computer Communication Link, Configuration by Computer, Print System Setup, Print Calibration/ Malfunfunction History

8.2 Instrument Setup by PC's over Serial Port

A Diskette program is provided with the ES762-ST2 that enables the user to rapidly configure the ES762-ST2 using a Personal Computer. Included on the diskette are common instrument applications which may be used as a starting point for your application. This permits the user to have an excellent starting point and helps speed the user through the instrument setup.

8.3 Operation of Serial Communication Port with Printers

ES762-ST2's RS-232 channel supports a number of operating modes. One of these modes is intended to support operation with a printer in metering applications requiring transaction printing, data logging and/or printing of calibration and maintenance reports.

For transaction printing, the user defines the items to be included in the printed document. The user can also select what initiates the transaction print generated as part of the setup of the instrument. The transaction document may be initiated via a front panel key depression.

In data logging, the user defines the items to be included in each data log as a print list. The user can also select when or how often he wishes a data log to be made. This is done during the setup of the instrument as either a time of day or as a time interval between logging.

The system setup and maintenance report list all the instrument setup parameters and usage for the current instrument configuration. In addition, the Audit trail information is presented as well as a status report listing any observed malfunctions which have not been corrected.

The user initiates the printing of this report at a designated point in the menu by pressing the print key on the front panel.

8.4 ES762-ST2 RS-232 Port Pinout

- 1 Handshake Line (cd in)
- 2 Transmit (tx)
- 3 Receive (rx)
- 4 Do Not Use
- 5 Ground
- 6 Do Not Use
- 7 RTS out
- 8 Do Not Use
- 9 DC Power Out*

* 8 VDC Power supplied on Pin 9 to power modem

9. RS-485 Serial Port (optional)

9.1 RS-485 Port Description:

The ES762-ST2 has a an optional general purpose RS-485 Port which may be used for any one of the following purposes:

- Accessing Process Parameters

 - Rate, Temperatures, Pressures, Density, Time & Date, Setpoints, AUX 3, AUX 4, AUX 3 - AUX 4.

- Accessing System Alarms

 - System, Process, Self Test, Service Test Errors

- Accessing Totalizers

 - Heat, Mass, Volume Totalizers and Grand Totalizers, AUX TOTAL 1, 2, 3, 4

- Executing Various Action Routines

 - Reset Alarms, Reset Totalizers, Print Transaction, Reset Error History,

9.2 General

The optional RS-485 card utilizes Modbus RTU protocol to access a variety of process parameters and totalizers. In addition, action routines can be executed. For further information, contact factory and request RS-485 Protocol manual.

9.3 Operation of Serial Communication Port with PC

The flow computer's RS-485 channel supports a number of Modbus RTU commands. Refer to port pinout (below) for wiring details. Modbus RTU drivers are available from third party sources for a variety of Man Machine Interface software for IBM compatible PC's.

The user reads and writes information from/to the RS-485 using the Modbus RTU commands. The ES762-ST2 then responds to these information and command requests.

Process variables and totalizers are read in register pairs in floating point format. Time and date are read as a series of integer register values. Alarms are individually read as coils. Action routines are initiated by writing to coils.

9.4 ES762-ST2 with RS-485 & Modbus RTU Protocol

When the ES762-ST2 is equipped with the RS-485 communication option, the protocol it uses is the Modbus RTU protocol. This protocol defines a message structure that hosts and clients will recognize and use on the RS-485 network over which they communicate. It describes the process a master device (PC compatible) uses to request access to another device (ES762-ST2), how it will respond to requests from the other devices, and how errors will be detected and reported. It establishes a common format for the layout and contents of message fields.

During communications on a Modbus RTU network, the protocol determines how each ES762-ST2 will know its device address, recognize a message addressed to it, determine the kind of action to be taken, and extract any data or other information contained in the message. If a reply is required, the ES762-ST2 will construct the reply message and send it using Modbus RTU protocol.

RTU Mode

The ES762-ST2 with RS-485 communications option supports the Modbus RTU (Remote Terminal Unit) mode only. The Modbus ASCII mode is not supported. The main advantage of the RTU mode is that its greater character density allows better data throughput than ASCII for the same baud rate. The Modbus RTU uses a Master-Slave Query-Response Cycle in which the ES762-ST2 is the slave device.

Control Functions

The ES762-ST2 with RS-485 communications option supports the following function codes:

CODE	NAME	DESCRIPTION
01	Read Coil Status	Read a single coil
03	Read Holding Register	Read a range of holding registers
05	Force Single Coil	Forces a single coil (0x reference) to either ON or OFF
06	Preset Single Register	Presets a value into a single holding register (4x reference)
15	Force Multiple Coil	Forces each coil (0x reference) in a sequence of coils to either ON or OFF
16	Preset Multiple Registers	Presets values into a sequence of holding registers (4x reference)

ES762-ST2 RS-485 Port Pinout (Terminal Block Option)

Terminal Block (TB-4) (optional)

<u>Term</u>	<u>Designation</u>
1	COM
2	Terminating Resistor (Connect to TX+ to terminate line)
3	TX+
4	TX-

Installation Overview

A two wire RS-485 may be multidropped up to 4000 ft. and up to 32 units may be chained together. A RS-485 to RS-232 interface adapter is required at the PC. An optically isolated type is recommended. Suitable wiring should be selected based on anticipated electrical interference. Terminators should be used to help improve the quality of electronic signals sent over the RS-485 wires. The RS-485 chain should be terminated at the beginning (RS-485 adaptor) and at the last device in the RS-485 chain and nowhere else. On the ES762-ST2 this is accomplished by connecting a jumper from the terminal labeled **Terminating Resistor (180 Ω)** to the terminal labeled **TX/RX(+)** at the RS-485 port. If lightning protection is required, a suitable surge protector should be used.

For additional information, refer to the technical requirements of EIA-485, interface adaptor user manual and the communication software user manual

ES762-ST2 Communication Setup Menu

The setup menu allows Modbus RTU Protocol communications parameters of: Device ID, Baud Rate, and Parity to be selected to match the parameters of your RS-485 network. Each ES762-ST2 must have it's own Device ID and the same Baud Rate and Parity setting.

10. Flow Computer Setup Software

The ES762-ST2 setup program provides for configuring, monitoring and controlling a ES762-ST2 unit. Sample applications are stored in disk files. The setup program calls these *Templates*. You can store the setup from the program's memory to either the ES762-ST2 (*Downloading* the file) or to a disk file (*Saving* the file) for later usage. Similarly you can load the setup in program memory from either a disk file (*Opening* a file) or from the ES762-ST2 unit (*Uploading* a file).

The program can monitor outputs from the unit while it is running.

The program can reset alarms and totalizers.

The peak demand may be reset when the option is supplied.

For assistance there are mini-helps at the bottom of each screen in the program. There is also context sensitive help available for each screen accessible by pressing the F1 key.

10.1 System Requirements:

IBM PC or compatible with 386 or higher class microprocessor

4 MB RAM

3 MB free disk space

VGA or higher color monitor at 640 x 480

Microsoft® Windows™ 3.1 or 3.11 or Windows 95/98™, XP, VISTA32

Communication Port - RS-232

RS-232 Cable (customer supplied)

10.2 Cable and Wiring Requirements:

The serial communication port on your PC is either a 25 pin or 9 pin connector. No cabling is supplied with the setup software. A cable must be purchased separately or made by the user. It is recommended to purchase a serial cable which matches the available communication port on you PC and a 9 pin male connection for the ES762-ST2 serial port.

10.3 Installation for Windows™

The Setup Software includes an installation program which copies the software to your hard drive.

Insert Setup Disk 1 in a floppy drive.

In the Program Manager, click File, and then select Run.

NOTE: For Windows 95™ Click the Start button, select Run and proceed as follows:

Type the floppy drive letter followed by a colon (:), and a backslash (\), and the word setup. For Example:

a:\setup

Follow the instructions on your screen.

10.4 Using the Flow Computer Setup Software

The setup software window consists of several menu "Tabs". Each tab is organized into groups containing various configuration and/or monitoring functions. To view the tab windows, simply click on the tab. The previous tab window will be hidden as the new tab window is brought to the foreground.

Caution: It is required that the ES762-ST2 unit which is being configured be kept in the operating mode while using the setup diskette. If not, uncertainty exists as to what information will be retained when the session is concluded.

10.5 File Tab

The File Tab has three sections. Any of the options on this tab can also be accessed from the File submenu.

The **Template Section** provides for opening and saving templates. The *Save* and *Save As* buttons provide the standard Windows functionality for dealing with files. The *Open* button is used to open existing templates.

The *Open* option allows for creating custom templates using the existing template in memory as the starting point. Assign a new name for this template. The template will be saved under this new name.

A typical scenario using the setup program would be the following:

- Open up a predefined template from the supplied list
- Choose 'Save As' to save this to a new file name
- Proceed to customize the template by making any changes that are needed
- Save the template to disk (if you want to reuse this template)
- Download the template to an attached unit.

The **Communications with ES762-ST2 Section** allows the user to upload the setup from the unit or download the program's current template to the unit.

The **Print (report) Section** allows the user to:

1. Configure the current Windows printer through the Select Printer option.
2. Print a Maintenance Report through the PC's printer using the Print Maintenance option.
3. Print the current setup through the PC's printer using Print Setup option.

10.6 Setup Tab

The Setup tab is where the majority of the ES762-ST2 instrument setup modifications are done. The Setup tab is divided into five sections.

System Section: Parameters, Display, Units

Input Section: Flow, Fluid, Compensation Inputs

Output Section: Pulse, Currents

Relay Section: Relays

Other Settings Section: Administration, Communication, Printing

NOTE: Many setup items are enabled or disabled depending on previous setup selections. It is important to work your way through the above list in the order shown. Be sure to verify your selections when you are through programming to insure that no settings were changed automatically.

10.7 View Tab

The View Tab screen allows for viewing selected group items on the PC in a similar format to that shown on the unit display. Data from the following groups can be viewed in the List of Values section:

- Process Parameters (i.e. rate, temperature)
- Totalizers (i.e. total, grand total)
- Input Signals
- Analog Output
- Error Status
- ES762-ST2 Software Version Information

The setup software assumes the current setup has been uploaded from the flow computer into the PC. It is important that the setup program and the ES762-ST2 unit are using the same setup information at all times or the data will be inconsistent. It is best to upload or download the setup before using this feature to synchronize the setups.

Error Log

Data from the error logger is viewed in a separate Error Log section on the screen.

To start the viewer, first check the boxes of items to view and then click the start button. The data will appear in the appropriate sections and will be continuously updated. The refresh rate is dependent on the number of items that are being viewed and the baud rate of the connection. Data in the List of Values section can be collapsed by clicking on the 'minus' sign in front of the group title. The data can be expanded by clicking on the 'plus' sign in front of the group title. If a group is collapsed and data in the group changes on refresh, the group will automatically expand. Data in the Error Log section does not expand or collapse. Changing the view items requires stopping the current viewing, checking the new selections and then restarting the viewer.

If communication errors occur while reading data from the ES762-ST2 device, the word 'Error' will appear in place of the actual value. If the connection to the ES762-ST2 is lost, the viewer will time out with a message saying the device is not responding.

The viewer will attempt to communicate with the ES762-ST2 device matching the device ID set in the communications screen. If you are having trouble establishing communication, compare settings for the PC and the flow computer. Also verify the connections between the PC and flow computer.

10.8 Misc. Tab

This tab has three sections: Tools, Actions and Options.

The tools section contains various system administration activities such as creating/modifying the initial sign-on screen or create print headers.

The Actions section is used to send commands to the ES762-ST2 unit.

Reset Totalizers, Reset Alarms, Simulations, Self Check, Reset Peak Demand (if equipped)

The Options section has the following selections:

Network Card Configuration

Additional capabilities may be provided in the future.

11. Glossary of Terms

Access Code

A numeric password which is entered by a user attempting to gain entry to change setup parameters.

AGA-3

A empirical flow equation applicable to orifice and several other square law flowmeters.

AGA-5

A gas flow equation for computing the combustion heat flow from measured volume flow, temperature and pressure as well as stored gas properties.

AGA-7

A gas flow equation for pulse producing, volumetric flowmeters which computes the equivalent flow at reference conditions from the measurements made at flowing line conditions.

Assign Usage

A menu selection during the setup of the instrument which selects the intended usage for the input/output.

Barometric Pressure

An entry of the average, local atmospheric pressure at the altitude or elevation of the installation. (typically 14.696 psia)

Beta

A important geometric ratio for a square law flowmeters.

Calibration

An order sequence of adjustments which must be performed in order for the equipment to operate properly.

Calibration Temperature

The temperature at which a flow sensor was calibrated on a test fluid.

Combustion Heat

The energy released by a fluid fuel during combustion .

Default

A value to be assumed for manual inputs or in the event of a failure in a input sensor.

Display Damping

An averaging filter constant used to smooth out display bounce.

DP Factor

A scaling constant for a square law flowmeter.

Error Log

A historical record which captures errors which have occurred.

Flow Equation

A recognized relationship between the process parameters for flow, temperature, pressure and density used in flow measurements.

Galvanic Isolation

Input and or output functions which do not share a conductive ground or common connection between them.

Gas Cor. Vol Eq.

An equation where the corrected volume flow of gas at STP is computer from measured volume flow, temperature and pressure as well as stored gas properties.

Gas Comb. Heat Eq.

An equation where the combustion heat flow of gas is computer from measured volume flow, temperature and pressure as well as stored gas properties.

Gas Mass Eq.

An equation where the mass flow of gas is computer from measured volume flow, temperature and pressure as well as stored gas properties.

Flowing Z-Factor

The mean Z-Factor under flowing conditions of temperature and pressure for a specific gas.

11. Glossary of Terms (Continued)

Full Scale

The value of the process variable at the full scale or maximum input signal.

Inlet Pipe Bore

The internal pipe diameter upstream of the flow measurement element.

Isentropic Exponent

A property of a gas or vapor utilized in orifice meter calculations.

K-Factor

The calibration constant for a pulse producing flowmeter expressed in pulses per unit volume

Linear

A flow measurement device where the output signal is proportional to flow.

Linear 16 Pt.

A mathematical approximation to a nonlinear device where by a correction factor or K-Factor table as a function of input signal is utilized to eliminate flowmeter nonlinearity.

Low Flow Cutoff

The value of input signal below which flow rate may be assumed to be 0 and at which totalization will cease.

Low Scale

The value of the process variable at the zero input signal.

Manual

An entry value to be used as a fixed condition in a equation

Meter Exp. Coef.

A coefficient in an equation which may be used to correct for changes in flowmeter housing dimensioned changes with temperature.

Protocol

An agreed upon method of information exchange.

Print Initiate

A user specified condition which must be satisfied for a transaction document to be printed.

Pulse Type

A menu selectable equivalent pulse output stage.

Pulse Value

An output scaling factor defining the equivalent amount of flow total represented by 1 output pulse.

Ref. Z-Factor

The Z-Factor for a gas at reference conditions of temperature and pressure.

Ref. Density

The density of a fluid at reference conditions of temperature and pressure.

Relay Function

The assigned usage for a relay output.

Relay Mode

The user's desired operating mode for the relay. Examples: follow, latch, timed pulse, above setpoint, below setpoint

Safe State

The state of an instrument's outputs which will occur during a power down state. The state the instrument assumes when the computations are paused.

Scroll List

The user's desired display list which can be presented on the two list display on Line 1 and/or L2 when the SCROLL key is depressed.

Self Check

A diagnostic sequence of steps a unit performs to verify it's operational readiness to perform it's intended function.

11. Glossary of Terms (Continued)

Service Test

A diagnostic sequence requiring specialized test apparatus to function to verify system readiness.

Setpoint

An alarm trip point.

Simulation

A special operating mode for an output feature which enables a service personnel to manually exercise the output during installation or trouble shooting operations.

Square Law Flowmeters

Types of measurement devices which measure differential pressure across a known geometry to make a flow measurement.

SQR LAW (Square Law w/o SQRT)

A square law flow measurement device equipped with a pressure transmitter with out a integral square root extractor.

SQR LAW-LIN (Square Law w/ SQRT)

A square law flow measurement device equipped with a pressure transmitter with integral square root extraction.

SQR Law 16PT (Square Law 16pt)

A mathematical approximation to a square law device where the discharge coefficient is represented as a table of DP Factor vs Reynold's Number.

Steam Delta Heat

A computation of the net heat of saturated steam equal to the total heat of steam minus the heat of water at the measured actual temperature.

Steam Heat

A computation of the total heat of steam.

Steam Net Heat

A computation of the net heat of steam equal to the total heat of steam minus the heat of water at the same saturated temperature.

STP Reference

The user's desired pressure and/or temperature to be considered as the reference condition in the computation of fluid properties or corrected volume conditions.

TAG

An alphanumeric designation for a particular instrument.

Time Constant

An averaging filter constant used to reduce bounce on the analog output. The high the number the slower the response, the greater filtering.

UVC

Universal Viscosity Curve is a representation of the calibration factor for a turbine flowmeter. It is expressed as a table of K-Factor as a function of Hz/CSTKS.

Viscosity Coef

A parameter in an equation which is used to estimate the viscosity as a function of temperature.

12. Diagnosis and Troubleshooting

12.1 Response of ES762-ST2 on Error or Alarm:

Error indications which occur during operation are indicated alternately with the measured values. The ES762-ST2 Flow Computer has four types of error:

TYPE OF ERROR	DESCRIPTION
System Alarms	Errors detected due to system failure
Sensor/Process Alarms	Errors detected due to sensor failure or process alarm conditions
Service Test Errors	Errors detected due to problems found during service test. (Service test can only be performed by qualified Factory service technicians because service code and special equipment are needed)
Self Test Errors	Errors detected during self test. (Each time the unit is powered, it runs a self test)

12.2 Diagnosis Flow Chart and Troubleshooting

All instruments undergo various stages of quality control during production. The last of these stages is a complete calibration carried out on state-of-the-art calibration rigs. A summary of possible causes is given below to help you identify faults.

12.3 Error Messages:

NOTE: The 24 VDC output has a self resetting fuse.

Error Message	Cause	Remedy
POWER FAILURE	Power has been interrupted	Acknowledge Error Remedy not required
WATCHDOG TIMEOUT	Possible transient	Acknowledge Error Remedy not required
COMMUNICATION ERROR	Possible Improper wiring or usage Message Transmission failure.	Check wiring and communication settings / protocol
CALIBRATION ERROR	Operator Error	Repeat Calibration
PRINT BUFFER FULL	Print buffer full, Data may be lost	Check paper and printer connections
WET STEAM ALARM	Temperature or pressure input has gone below the saturated steam range of the internal steam tables	Check application, Insure that all sensors are working properly
OFF FLUID TABLE	Temperature or pressure input has gone below or exceeded the range of the internal steam tables	Check application, Insure that all sensors are working properly
FLOW IN OVERRANGE	Flow input has exceeded input range (if stacked, may be lo or hi transmitter)	Check sensor calibration
INPUT 1 OVERRANGE	Input 1 signal from sensor has exceeded input range	Check sensor calibration
INPUT 2 OVERRANGE	Input 2 signal from sensor has exceeded input range	Check sensor calibration
INPUT 3 OVERRANGE	Input 3 signal from sensor has exceeded input range	Check sensor calibration
INPUT 4 OVERRANGE	Input 4 signal from sensor has exceeded input range	Check sensor calibration
FLOW LOOP BROKEN	Open circuit detected on flow input (if stacked, may be lo or hi transmitter)	Check wiring and sensor
LOOP 1 BROKEN	Open circuit detected on input 1	Check wiring and sensor
LOOP 2 BROKEN	Open circuit detected on input 2	Check wiring and sensor
LOOP 3 BROKEN	Open circuit detected on input 3	Check wiring and sensor
LOOP 4 BROKEN	Open circuit detected on input 4	Check wiring and sensor
RTD 1 OPEN	Open circuit detected on RTD 1 input	Check wiring and RTD
RTD 1 SHORT	Short circuit detected on RTD 1 input	Check wiring and RTD

12.3 Error Messages: (Continued)

Error Message	Cause	Remedy
RTD 2 OPEN	Open circuit detected on RTD 2 input	Check wiring and RTD
RTD 2 SHORT	Short circuit detected on RTD 2 input	Check wiring and RTD
PULSE OUT OVERRUN	Pulse output has exceeded the internal buffer	Adjust pulse value or pulse width
Iout 1 OUT OF RANGE	Current output 1 is below or above specified range	Adjust the "0"/ "Full Scale" values or increase/ lower flowrate
Iout 2 OUT OF RANGE	Current output 1 is below or above specified range	Adjust the "0"/ "Full Scale" values or increase/ lower flowrate
TOTALIZER ERROR		
RELAY 1 HI ALARM	Relay 1 is active due to high alarm condition	Not required
RELAY 1 LO ALARM	Relay 1 is active due to low alarm condition	Not required
RELAY 2 HI ALARM	Relay 2 is active due to high alarm condition	Not required
RELAY 2 LO ALARM	Relay 2 is active due to low alarm condition	Not required
RELAY 3 HI ALARM	Relay 3 is active due to high alarm condition	Not required
RELAY 3 LO ALARM	Relay 3 is active due to low alarm condition	Not required
24VDC OUT ERROR	24V output error detected during service test run	By Factory Service
PULSE IN ERROR	Pulse input error detected during service test run	By Factory Service
INPUT 1 Vin ERROR	Error detected on input 1 voltage input during service test run	By Factory Service
INPUT 1 Iin ERROR	Error detected on input 1 current input during service test run	By Factory Service
INPUT 2 Iin/RTD ERROR	Error detected on input 2 during service test run	By Factory Service
INPUT 3 Iin/RTD ERROR	Error detected on input 3 during service test run	By Factory Service

Error Message	Cause	Remedy
PULSE OUT ERROR	Pulse output error detected during service test run	By Factory Service
Iout 1 ERROR	Current output 1 error detected during service test run	By Factory Service
Iout 2 ERROR	Current output 2 error detected during service test run	By Factory Service
RELAY 1 ERROR	Relay 1 error detected during service test run	By Factory Service
RELAY 2 ERROR	Relay 2 error detected during service test run	By Factory Service
RS-232 ERROR	RS-232 error detected during service test run	By Factory Service
A/D MALFUNCTION	Error detected in A/D converter during self test	By Factory Service
PROGRAM ERROR	Error on access to the program memory	By Factory Service
SETUP DATA LOST	All or part of the EEPROM data for setup is damaged or has been overwritten	Re-Enter setup data, If problem persists, Factory service required
TIME CLOCK LOST	The real time clock data was lost during extended power outage	Re-Enter time and date
DISPLAY MALFUNCTION	A display malfunction has been detected.	By Factory Service
RAM MALFUNCTION	Part or all of the internal RAM is damaged	By Factory Service
TRAP ERROR	Steam trap malfunction	Service steam trap
TRAP BLOWING	Steam trap malfunction	Change error delay
DATALOG LOST	Contents of datalog were corrupt and lost	Clear datalog, Clear errors

WARRANTY

This product is warranted against defects in materials and workmanship for a period of two (2) years from the date of shipment to Buyer.

The Warranty is limited to repair or replacement of the defective unit at the option of the manufacturer. This warranty is void if the product has been altered, misused, dismantled, or otherwise abused.

ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, ARE EXCLUDED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

DECODING PART NUMBER

Ex: **ES762ST2 L 1 1 P 13TB**

Series: _____
 ES762ST2 = Utility Metering Flow Computer

Display Type: _____
 L= LCD
 V= VFD

Input Type: _____
 1= 85 to 276 VAC
 3= 24 VDC (16 to 48 VDC)

Network Card: _____
 1= RS485/Modbus (standard)

Mounting: _____
 P= Panel Mount
 *N= NEMA 4 Wall Mount (see MS811)
 *W= NEMA 12/13 Wall Mount w/ Clear Cover

Options: _____
 13 = Superchip; 2 relay, Positive heat only (standard)
 TB= RS485 Terminal Block standard for Panel Mount (P) and NEMA4 Wall (N) Mounting Styles

Accessories:
 ST2 SETUP PRO - Advanced setup software for ST2 family
 KEPS-KEP1-32
 KEP RS232 for SUPERtrol 1, SUPERtrol 1LE, SUPERtrol 2 and LEVELtrol 2 • 32 Bit DDE Server
 KEPS-MBS32
 Supports RS485 for ST1, ST1LE, ST2, LT2, MRT, DRT & MB2 (Modbus RTU)
 Modem Available, see MPP-56KN, MPP-2400 and MPP-2400N
 Serial printer available, see P1000, P295
 Ethernet Port Server available, see IEPS
 RS-422/485 to RS-232 Communication Adaptor available, see CA285
 RS232 Extender Cable: P/N=13220-<length in inches>
 Remote metering and data collection software available, see TROLLink
