# 1. INTRODUCTION

## Regarding this User's Manual

- This manual is additional to the standard manual IM 01R04B04-00-E. All information and specifications which are not specially for Modbus type must be regarded in the standard manual.
- These manuals should be provided to the end user.
- Before use, read these manuals thoroughly to comprehend its contents.
- The contents of these manuale may be changed without prior notice.
- All rights are reserved. No part of this manual may be reproduced in any form without Yokogawa's written permission.
- Yokogawa makes no warranty of any kind with regard to this material, including, but not limited to, implied warranties of merchantability and suitability for a particular purpose.
- All reasonable effort has been made to ensure the accuracy of the contents of this manual. However, if any errors or omissions are found, please inform Yokogawa.
- Yokogawa assumes no responsibilities for this product except as stated in the warranty.
- Please note that this user's manual may not be revised for any specification changes, construction changes or operating part changes that are not considered to affect function or performance.
- If the customer or any third party is harmed by the use of this product, Yokogawa assumes no responsibility for any such harm owing to any defects in the product which were not predictable, or for any indirect damages.

Blank Page

## **2. AMPLIFIER FOR MODBUS COMMUNICATION**

Refer to IM 01R04B04-00E for further details about the amplifier. This section encompasses topics applicable to only the Modbus communication type.

### **2.1 Characteristics of the ROTAMASS with Modbus Communication type**

Rota Yokogawa has two Modbus communication type options for ROTAMASS 3 Series in the portfolio: /MB2 and /MB3

These two options differ in the output and input capabilities.

- I/O connection with /MB2:

- 1 Modbus RS-485 communication line

- I/O connection with /MB3:

- 1 Modbus RS-485 communication line
  - 1 Current output with HART communication
  - 1 Pulse / status output
  - 1 Status input

Please consider the following limitation:

- (1) Only one current output (Iout1) exists.
- (2) No intrinsically safe outputs are available.
- (3) Simultaneous write access of Modbus and HART should be avoided.
- (4) The display is just available in English language.

### **2.2 Specification**

For specifications other than below, refer to chapter 11 "Technical Data" of IM 01R04B04-00E.

- Modbus® communication (/MB1, /MB2 + /MB3)
- Physical interface RS485 as two wire data bus according EIA/TIA-485
- Maximal bus length is depending from bus topology and communication speed.
- Addresses: 1 to 247
- Baud rates: 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200
- Data formats: E/1, O/1, N/1, N/2 (parity/stop bits)
- Modes: RTU, ASCII

# 3. ABOUT MODBUS

## 3.1 Outline

Modbus is an open bi-directional digital communication protocol widely used in the industrial environment.

The Modbus communication type of the ROTAMASS 3 is in accordance with the specification of the Modbus Organization, and consequently provides interoperability with devices from various manufacturers.

Featuring transmission of all measurement variables and units as input registers and other parameters as holding registers, the Modbus communication type's software enables a flexible instrumentation system to be implemented.

For more information about engineering, design, construction work, start-up and maintenance of Modbus, refer to the Modbus Organization ([www.modbus.org](http://www.modbus.org)).

## 3.2 Wiring System Configuration

The number of devices that can be connected to a single bus without repeater is 32. The maximum cable length depends on baud rate, cable properties and network configuration. When constructing systems, both the basic and overall design must be carefully considered to allow device performance to be fully exhibited.

The following instruments are required for use with Modbus devices:

- **Termination:**

Modbus requires two terminations at the ends of the trunk line. Refer to the supplier for details of terminations.

- **Field devices:**

Connect your Modbus communication type ROTAMASS 3 Series to a v. One or more ROTAMASS 3 Series and other field devices can be connected. For the terminal assignment on the ROTAMASS 3 Series, see chapter 4.1.

- **Host:**

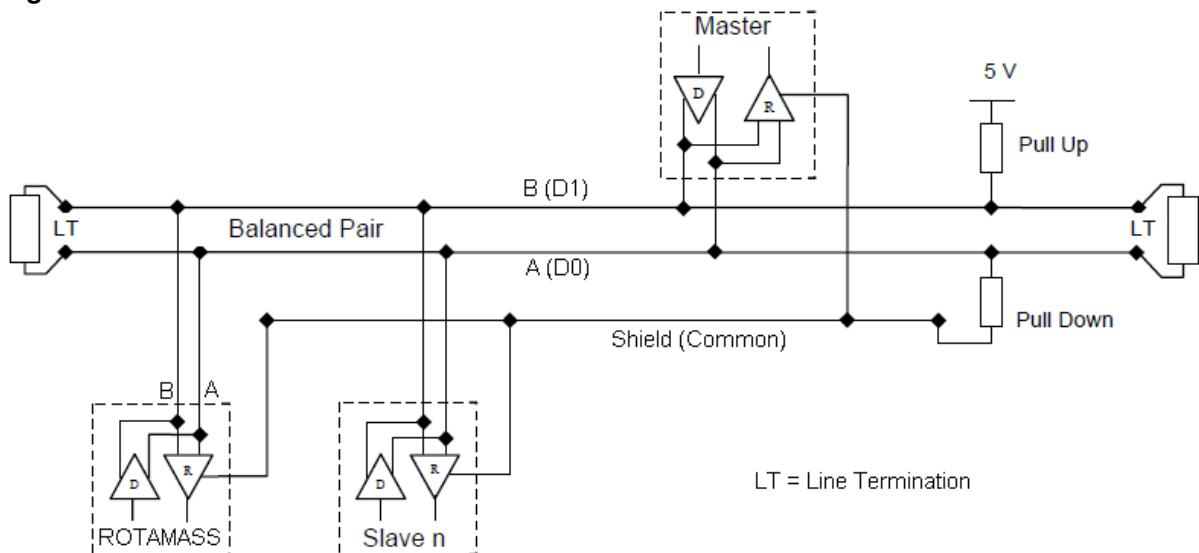

Used for accessing field devices. A dedicated host (such as DCS) is used for an instrumentation line while dedicated communication tools are used for startup or maintenance. For operation of the host, refer to the instruction manual for each host. No details of the host are explained in the rest of this manual.

- **Cable:**

Used for connecting devices. Refer to [http://www.modbus.org/docs/Modbus\\_over\\_serial\\_line\\_V1\\_02.pdf](http://www.modbus.org/docs/Modbus_over_serial_line_V1_02.pdf) for details of instrumentation cabling. If the total length of the cable is in a range of 2 to 3 meters for laboratory or other experimental use, the following simplified cable (a twisted pair wire with a cross section of 0.9 mm<sup>2</sup> or more and cycle period of within 5 cm (2 inches) may be used). Termination processing depends on the type of device being deployed. For the ROTAMASS, clamp terminal are used.

Connect the devices as shown in Figure 3.1. Connect the terminations at both ends of the trunk, with a minimum length of the spur for connection.

The polarity of signal must be maintained.

**Figure 3.1 Device Connection**

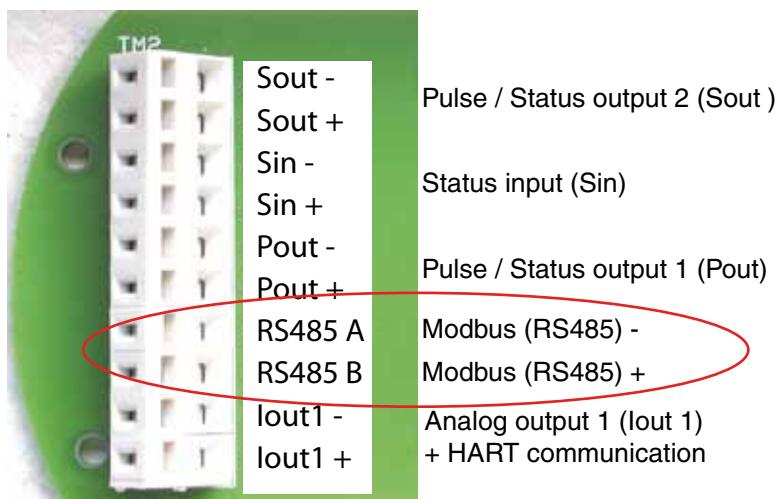

Before using a Modbus configuration tool other than the existing host, confirm it does not affect the loop functionality in which all devices are already installed in operation. Disconnect the relevant control loop from the bus if necessary.

## 4. GETTING STARTED

Modbus is a digital communication protocol and differs in operation from 4 to 20 mA transmission and the HART communication. It is recommended that users use Modbus devices in accordance with the procedures described in this section. The procedures assume that Modbus devices will be set up on a bench of an instrument shop.

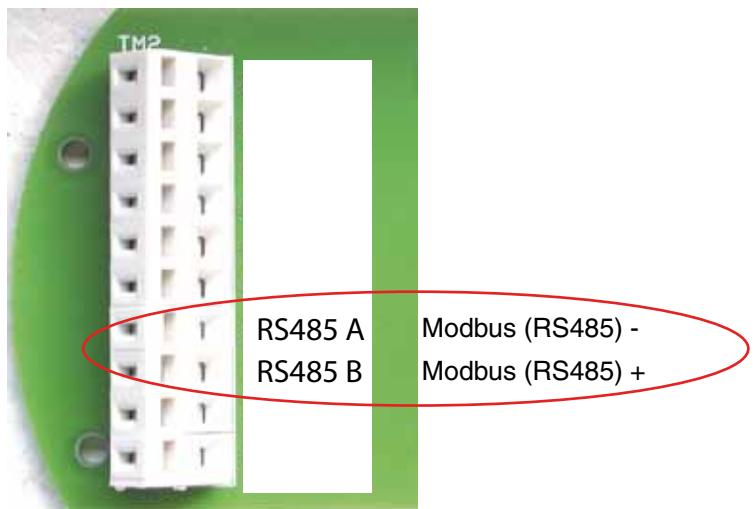

### 4.1 Wiring in ROTAMASS 3 Terminal Box

Figure 4.1 I/O-Terminal Overview Option /MB3

F31.EPS

Figure 4.2 I/O-Terminal Overview Option /MB2

F32.EPS

#### Wiring:

- Confirm one ferrite core is attached to the flowmeter.
- Insert the power cable into the ferrite core before connecting to the terminals. Fix the ferrite core to the cable with clamping wire.

- Connect the power cables to the terminals according to the figures below.
- Connect the Modbus- cables to the terminals according to the figure below.
- For the connection of protective ground conductor to PE terminal of RCCF31 / RCCT3□ use a crimp-on ring type terminal. For RCCR31 connect the protective ground conductor to PE terminal of terminal board.

**NOTE**

The maximum length of Modbus cable depends on different influences. Please see the Modbus-specification.

## 4.2 Communication Setting

To activate Modbus, the following settings are required. They are located in the Modbus Communication menu in "Detailed Setup".

**IMPORTANT**

Do not turn off the power supply immediately after setting. When the parameters are saved to the EEPROM, the redundant processing is executed for the improvement of reliability. If the power is turned off within 60 seconds after setting is made, the modified parameters are not saved and the settings may return to the previous values.

**Table 4.1 Communication Parameters (Bold values: default settings)**

Function	Parameter	Description and Setting
Device address	Device address	Select: <b>1</b> to 247  Set the device address for ROTAMASS where the host expects to communicate. Make sure that no other device on the bus uses the same address!
Baud rate	Baud rate	Select: 1200, 2400, 4800, 9600, <b>19200</b> , 38400, 57600, 76800, 115200  Make sure that host and ROTAMASS use the same baud rate for communication
Communication settings	Data format	Select: <b>Even 1 stop bit</b> , Odd 1 stop bit, None 1 stop bit, None 2 stop bits  Make sure that host and ROTAMASS use the same communication settings.
Bus mode	Modbus mode	Select: <b>RTU</b> , ASCII  Make sure that host and ROTAMASS communicate in the same Modbus mode.
Modbus initialization	Modbus init	 <b>IMPORTANT</b> The Modbus communication module must be restarted after changing any of the above settings! This can be done by either powering off and on the device or by executing the function "Modbus init". Please note that the settings in the menu will be updated after initialization of the Modbus communication module.

## 4.3 Reading and Writing Values

Unlike other communication protocols Modbus does not use standardized device description files but store data and parameters in registers. An overview of the Modbus registers of ROTAMASS can be found in chapter 7.

For configuration the ROTAMASS Modbus communication tool is available from Yokogawa which can address parameters of ROTAMASS which are mapped onto Modbus. The tool can be found on the DVD which is attached to each device. It is running under all recent PC- system and supports all communication settings of ROTAMASS. To connect to ROTAMASS the user needs a RS232 to RS485 or USB to RS485 converter.

# **5. OPERATION OF ROTAMASS 3 SERIES MODBUS COMMUNICATION TYPE**

## **5.1 Operation via display**

For general information regarding the operation via display refer to the instruction manual of the standard type IM 01R04B04-00E-E. For the Modbus communication type the operation via display is basically the same. Extensions and restrictions are described below:

1. A menu has been added to "Detailed Setup" to configure the Modbus communication settings of ROTAMASS. To establish communication please make sure to match the communication settings of your host system.
2. Only the English language is available.
3. Current output 2 is not available for Modbus communication type. All menu items referring to current output 2 have therefore been removed from the display menu.

### **NOTE**

Due to the ability of /MB3 to communicate simultaneously via HART and Modbus the operation of the display menu is slightly slower than experienced with a standard device.

## **5.2 Operation via HART**

ROTAMASS 3 Series Modbus communication type supports also full configuration via HART communication protocol on current output 1.

For wiring and general information regarding the operation via HART communication protocol refer to the instruction manual of the standard type IM 01R04B04-00E-E.

Unless a special DD/DTM for the Modbus communication type is available the standard DD/DTM will be loaded. Therefore a few restrictions apply:

1. The Modbus communication settings menu is not available via HART but only in the display menu of ROTAMASS.
2. When changing the menu text to German, the display language will remain in English since German language texts are not available.
3. All settings for current output 2 are visible in the standard DD/DTM. However, any settings made for current output 2 will have no effect in the device since this output is not available.

## **5.3 Operation via Modbus**

All ROTAMASS 3 Series Modbus communication options support reading access to all measurement values in holding and input registers. Configuration of all parameters via Modbus is also supported.

For detailed information of available parameters refer to the menu tree in chapter 6.

For configuration of selection parameters for each selection a specific value has to be written. The selection values are found in the table in chapter 7.

### **NOTE**

The Modbus communication settings of ROTAMASS can be changed via Modbus. However, communication continues with the previous settings. The new settings will only be taken in effect after execution of the function "Modbus Init" or a restart of ROTAMASS.

### **IMPORTANT**

Other communication protocols handle dependencies and refreshes of parameters in device description files. In the opposite Modbus accesses only single registers (values or parameters) and the host has usually no information about any other conditions. Furthermore according Modbus specification only few exception codes for certain transmission errors are defined. Therefore only physical transmission is secured by the protocol but any logical check has to be done individually by the host system. For more information refer to chapter 8.

### 5.3.1 Operation via Modbus option /MB2

ROTAMASS 3 Series Modbus communication option /MB2 support reading access to all measurement values in holding and input registers.

With option /MB2 all input/output relevant registers and HART relevant registers are not accessible.

No input/output functions are available and physically connected. Consequently no HART communication is possible.

The option /MB2 supports only Modbus communication.

### 5.3.2 Operation via Modbus option /MB3

ROTAMASS 3 Series Modbus communication option /MB3 support reading access to all measurement values in holding and input registers.

The configuration of all parameters via Modbus is supported.

Modbus communication option /MB3 is the further developed option /MB1.

## 6. PARAMETER TREE, DISPLAY MENU

Parameters in dark grey are not mapped onto Modbus for ROTAMASS with option /MB2 and /MB3. In option /MB2 parameters in light grey cannot be accessed via HART communication on current output 1 or via the display menu. The output functions are not available. The default value of selection items is typed in bold letters.

# 7. MODBUS REGISTERS

## 7.1 Register Mapping

Used Modbus register types:

Register type	Size	Data Format	Data Type	Description
Short	16 bit	US16	Integer (2 Byte)	Unsigned 16-bit integers in the range of 0 to 65535.
Long	32 bit	US32	2 Integer (4 Byte)	Unsigned 32-bit integers in the range of 0 to 4294967295. 2 consecutive registers used to store the value.
Float	32 bit	FL32	Floating-point (4 Byte)	Float value in single precision in the IEEE-754 format.. 2 consecutive registers used to store the value.
String	16 bit	US16	8-bit ASCII (n * 2 Byte)	One or more consecutive registers. Each register contains 2 ASCII characters.

Legend:

<b>Option /MB1</b>	Parameter available in Option /MB1
<b>Option /MB2</b>	Parameter available in Option /MB2
<b>Option /MB3</b>	Parameter available in Option /MB3
<b>Data format</b>	Used register types
<b>No. 16 bit Register</b>	Number of used registers per value
<b>Read/Write</b>	Register is readable or writable or both
<b>Holding register Modicon</b>	Address offset of 40001 to Modicon holding register mapping
<b>Input register Modicon</b>	Address offset of 30001 to Modicon input register mapping
<b>Flex Input</b>	This register can be mapped to the “Flexible Input Register”
<b>Flex Holding</b>	This register can be mapped to the “Flexible Holding Register”

The Modbus registers are mapped into the following areas:

Parameter	Option /MB1	Option /MB2	Option /MB3	Data format	No. 16 bit Register	Read Write	Address			
							R/W	Holding Register	Holding Register Modicon	Input Register
Fast Access area Input register	x	x	x	US16 or FL32	1 or 2	R	4x	-	-	3x
										0 30001
										... ...
Fast Access area Flex input register	-	x	x	US16 or FL32	1 or 2	R	-	-	-	96 30097
										98 30099
										... ...

## 7.6 Modbus Holding Register Settings for Outputs

All available parameters are assigned to holding registers wherein the measurement values are assigned to input registers on Modbus. A list of all available parameters and registers for Modbus communication option /MB2 and option /MB3 can be found in the table below. The table contains also the selection values which can be written to selection parameters.

Parameter	Data range	Selection	Unit	Register	Read Write	Address	
					R, W	Holding register	Input register

## 7.8 Modbus Flexible Register

This section describes the functionality of the flexible register and their configuration.  
The 3 Series Modbus communication type offers

- 20 flexible “Input registers” for fast Modbus reading, up to 10 “FL32 values” or 10 “US16 values” can be assigned for reading
- 20 flexible “Holding registers” for fast Modbus writing, up to 10 “FL32 values” or 10 “US16 values” can be assigned for writing
- 4 predefined “Holding registers” for fast Modbus writing, 4 predefined functions can be executed with fast access
- Transmission time for fast reading, writing and executing: see chapter 8.8

**Table 7.8.1 Flexible Input Register Selection**

Parameter	Data Value	Selection	Unit	Register	Read Write	Address	
					R, W	Holding register	Input register
Flex input register select 01	0	Holding reg	-	US16	R/W	6912	-
Flex input register select 02	0	Holding reg	-	US16	R/W	6928	-
Flex input register select 03	0	Holding reg	-	US16	R/W	6944	-
Flex input register select 04	0	Holding reg	-	US16	R/W	6960	-
Flex input register select 05	0	Holding reg	-	US16	R/W	6976	-
Flex input register select 06	0	Holding reg	-	US16	R/W	6992	-
Flex input register select 07	0	Holding reg	-	US16	R/W	7008	-
Flex input register select 08	0	Holding reg	-	US16	R/W	7024	-
Flex input register select 09	0	Holding reg	-	US16	R/W	7040	-
Flex input register select 10	0	Holding reg	-	US16	R/W	7056	-

Up to 10 holding registers can be mapped to the fast reading area by writing a “Holding Register Address” to the “Flex input register select □□”. After configuring of the “Flex input register select □□” the Modbus communication has to be initialized by “Modbus Init”.

After “Modbus Init” the “Holding Register” can be read with fast access.

The configuration of the “Flex input register select □□” will be reset to 0 after performing “Master Reset”.

All “Holding Register” in the range 512 to 4992 can be mapped to the flex input register except the “Modbus Specific Register” in chapter 7.4.

**Table 7.8.2 Flexible Holding Register Selection**

Parameter	Data Value	Selection	Unit	Register	Read Write	Address	
						R, W	Holding register
Flex holding reg. select 01	0	Holding reg	-	US16	R/W	7072	-
Flex holding reg. select 02	0	Holding reg	-	US16	R/W	7088	-
Flex holding reg. select 03	0	Holding reg	-	US16	R/W	7104	-
Flex holding reg. select 04	0	Holding reg	-	US16	R/W	7120	-
Flex holding reg. select 05	0	Holding reg	-	US16	R/W	7136	-
Flex holding reg. select 06	0	Holding reg	-	US16	R/W	7152	-
Flex holding reg. select 07	0	Holding reg	-	US16	R/W	7168	-
Flex holding reg. select 08	0	Holding reg	-	US16	R/W	7184	-
Flex holding reg. select 09	0	Holding reg	-	US16	R/W	7200	-
Flex holding reg. select 10	0	Holding reg	-	US16	R/W	7216	-

Up to 10 holding registers can be mapped to the fast writing area by writing a “Holding Register Address” to the “Flex holding register select □□”. After configuring of the “Flex holding register select □□” the Modbus communication has to be initialized by “Modbus Init”.

After “Modbus Init” the “Holding Register” can be written with fast access.

The configuration of the “Flex holding register select □□” will be reset to 0 after performing “Master Reset”.

When writing to a “Fast Holding Register” the new value will be stored and the Modbus response will not wait for the action. The appropriate action is performed after the communication when the new written value is different to the old one in the register.

All “Holding Register” in the range 512 to 4992 can be mapped to the flex holding register except the “Modbus Specific Register” in chapter 7.4.

The following 4 holding register are mapped fix to the fast writing area. To initiate an action a valid value has to be written. To inhibit the functionality and prepare it for the next action a subsequent “0” has to be sent. Writing the same value as before does not cause an action.

**Table 7.8.3 Modbus predefined Holding Register**

Parameter (holding register)	Option /MB1	Option /MB2	Option /MB3	Flex input	Flex holding	Data format	16 bit Register	Read Write	Address			
									Holding register	Modicon	Input register	Modicon
Total reset (fast access)	-	x	x	-	-	US16	1	W	0	40001	-	-
Autozero exe (fast access)	-	x	x	-	-	US16	1	W	1	40002	-	-
Modbus init (fast access)	-	x	x	-	-	US16	1	W	2	40003	-	-
Master reset (fast access)	-	x	x	-	-	US16	1	W	3	40004	-	-

### 7.8.1 Register of “Fast reading/writing area”

Parameter (holding register)	Option /MB1	Option /MB2	Option /MB3	Flex input	Flex holding	Data format	16 bit Register	Read Write	Address			
									Holding register	Modicon	Input register	Modicon
	R, W		4x									3x

## 7.8.2 Example for “Fast reading”

Example:

Setting 3 “Float Values” for fast read access

The following example shows the selection of 3 float values assigned to the flex input register for “Fast reading”

Write the addresses of the three selected register into the

“Flex input register select 01”

“Flex input register select 02”

“Flex input register select 03”

Perform Modbus initialization by writing “1” to the holding register “Modbus init (Restart Modbus)” addr. 2256 (42257).

After Modbus initialization the selected values can be read via the

“Flex input register 01/02”

“Flex input register 03/04”

“Flex input register 05/06”

### Result of Flex input register selection

Parameter (holding register)	Value	Selection	Unit	Register	Read Write	Address	
					R, W	Holding register	Input register
Flex input register select 01	528	Mass Flow	-	US16	R/W	6912	-
Flex input register select 02	576	Density	-	US16	R/W	6928	-
Flex input register select 03	3168	Drive Gain	-	US16	R/W	6944	-

### Result of Flex input register (after performing "Modbus Init")

Parameter (holding register)	Selection	Unit	Register	Read Write	Address	
				R, W	Holding register	Input register
Flex input register 01	Mass flow	Mass flow unit	FL32	R	-	98
Flex input register 03	Density	Density unit	FL32	R	-	100
Flex input register 05	Drive Gain	V	FL32	R	-	102

**Example:**

Setting 2 “Float Values” and 2 “Unit values” for fast read access

The following example shows the selection of 2 float values and 2 US16 register assigned to the flex input register for “Fast reading”. Write the addresses of the four selected register into the

“Flex input register select 01”

“Flex input register select 02”

“Flex input register select 03”

“Flex input register select 04”

Perform Modbus initialization by writing “1” to the holding register “Modbus init (Restart Modbus)” addr. 2256 (42257).

After Modbus initialization the selected values can be read via the

“Flex input register 01/02”

“Flex input register 03”

“Flex input register 04/05”

“Flex input register 6”

**Result of Flex input register selection**

Parameter (holding register)	Value	Selection	Unit	Register	Read Write	Address	
					R, W	Holding register	Input register
Flex input register select 01	528	Mass Flow	-	US16	R/W	6912	-
Flex input register select 02	1072	Mass Flow Unit	-	US16	R/W	6928	-
Flex input register select 03	576	Density	-	US16	R/W	6944	-
Flex input register select 04	1392	Density Unit	-	US16	R/W	6960	-

**Result of Flex input register (after performing "Modbus Init")**

Parameter (holding register)	Selection	Unit	Register	Read Write	Address	
				R, W	Holding register	Input register
Flex input register 01	Mass flow	Mass flow unit	FL32	R	-	98
Flex input register 03	Mass flow Unit	-	US16	R	-	100
Flex input register 04	Density	Density unit	FL32	R	-	101
Flex input register 06	Density Unit	-	US16	R	-	103

### 7.8.3 Example for “Fast writing”

Example:

Setting 3 “Float Values” for fast write access

The following example shows the selection of 3 float values assigned to the flex holding register for “Fast writing”.

Write the addresses of the three selected register into the

“Flex holding register select 01”

“Flex holding register select 02”

“Flex holding register select 03”

Perform Modbus initialization by writing “1” to the holding register “Modbus init (Restart Modbus)” addr. 2256 (42257).

After Modbus initialization the selected values can be read or written via the

“Flex holding register 01/02”

“Flex holding register 03/04”

“Flex holding register 05/06”

#### Result of Flex holding register selection

Parameter (holding register)	Value	Selection	Unit	Register	Read Write	Address	
					R, W	Holding register	Input register
Flex holding register select 01	2288	Ref. density carrier	-	US16	R/W	7072	-
Flex holding register select 02	2304	Temp. coeff. A carrier	-	US16	R/W	7088	-
Flex holding register select 03	2320	Temp. coeff. B carrier	-	US16	R/W	7104	-

#### Result of Flex holding register (after performing "Modbus Init")

Parameter (holding register)	Selection	Unit	Register	Read Write	Address	
				R, W	Holding register	Input register
Flex holding register 01	Ref. density carrier	-	FL32	R/W	4	40005
Flex holding register 03	Temp. coeff. A carrier	Temp unit	FL32	R/W	6	40007
Flex holding register 05	Temp. coeff. B carrier	Temp unit	FL32	R/W	8	40009

**Example:**

Setting 2 “Float Values” and 2 “Unit values” for fast write access

The following example shows the selection of 2 float values and 2 US16 register assigned to the flex holding register for “Fast writing”. Write the addresses of the four selected register into the

“Flex holding register select 01”

“Flex holding register select 02”

“Flex holding register select 03”

“Flex holding register select 04”

Perform Modbus initialization by writing “1” to the holding register “Modbus init (Restart Modbus)” addr. 2256 (42257).

After Modbus initialization the selected values can be read or written via the

“Flex holding register 01”

“Flex holding register 02/03”

“Flex holding register 04/05”

“Flex holding register 6”

**Result of Flex holding register selection**

Parameter (holding register)	Value	Selection	Unit	Register	Read	Address	
					Write	R, W	Holding register
Flex holding register select 01	1072	Temp Unit	-	US16	R/W	7072	-
Flex holding register select 02	2304	Temp. coeff. A carrier	-	US16	R/W	7088	-
Flex holding register select 03	2320	Temp. coeff. B carrier	-	US16	R/W	7104	-
Flex holding register select 04	1392	Density Unit	-	US16	R/W	7120	-

**Result of Flex holding register (after performing "Modbus Init")**

Parameter (holding register)	Selection	Unit	Register	Read	Address	
				Write	R, W	Holding register
Flex holding register 01	Temp unit	-	US16	R/W	4	40005
Flex holding register 02	Temp. coeff. A carrier	Temp unit	FL32	R/W	5	40006
Flex holding register 04	Temp. coeff. B carrier	Temp unit	FL32	R/W	7	40008
Flex holding register 06	Density Unit	-	US16	R/W	9	40010

# 8. TECHNICAL DETAILS OF MODBUS COMMUNICATION

## 8.1 Supported Modbus Register Types

Register type	Size	Data Format	Data Type	Description
Short	16 bit	US16	Integer (2 Byte)	Unsigned 16-bit integers in the range of 0 to 65535.
Long	32 bit	US32	2 Integer (4 Byte)	Unsigned 32-bit integers in the range of 0 to 4294967296 2 consecutive registers used to store the value.
Float	32 bit	FL32	Floating-point (4 Byte)	Float value in single precision in the IEEE-754 format. 2 consecutive registers used to store the value.
String	16 bit	STRING	8-bit ASCII (n * 2 Byte)	One or more consecutive registers. Each register contains 2 ASCII characters.

## 8.2 Supported Modbus Function Codes

ROTAMASS 3 Series Modbus communication type supports the following “Function Codes” to communicate with the host.

Function Code Description	Function Code	Data Type	Register Address
Read holding register	03	0x03	16-bit Integer
Read input register	04	0x04	16-bit Integer
Write single register (holding)	06	0x06	16-bit Integer
Write multiple register (holding)	16	0x10	16-bit Integer
Report slave ID	17	0x11	16-bit Integer
Read/Write multiple register	23	0x17	16-bit Integer
Read device identification	43	0x2B	16-bit Integer

## 8.3 Supported Exception Codes

ROTAMASS 3 Series Modbus communication type supports the following “Exception Codes” to indicate physical transmission errors.

Exception Code Description	Exception Code	Description
Illegal function	1	0x01
Illegal data address	2	0x02
Illegal data value	3	0x03

## 8.4 Modbus Initialization

Parameter (holding register)	Option /MB1	Option /MB2	Option /MB3	Flex input	Flex holding	Data format	16 bit Register	Read Write	Address			
									Holding register	Holding register Modicon	Input register	Input register Modicon
<b>Modbus initialization</b>												
Device address	x	x	x	-	-	US16	1	R/W	512	40513	-	-
Baud rate, Data format	x	x	x	-	-	US16	1	R/W	513	40514	-	-
Modbus mode	x	x	x	-	-	US16	1	R/W	514	40515	-	-
Modbus option	-	x	x	-	-	US16	1	R	2000	42001	-	-
Modbus init (Restart Modbus)	x	x	x	-	-	US16	1	W	2256	42257	-	-
Master reset	x	x	x	-	-	US16	1	W	2880	42881	-	-

**Table 8.4.1 Modbus initialization**

Register	Parameter	Description and Setting
Holding register 512	Device address	Select: 1 to 247 Set the device address for ROTAMASS 3 where the host expects to communicate. Make sure that no other device on the bus uses the same address.
Holding register 513	Baud rate	Select: 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200 Make sure that host and ROTAMASS 3 use the same baud rate for communication
Holding register 513	Data format	Select: Even 1 stop bit, Odd 1 stop bit, None 1 stop bit, None 2 stop bits Make sure that host and ROTAMASS 3 use the same communication settings.
Holding register 514	Modbus mode	Select: RTU, ASCII Make sure that host and ROTAMASS 3 communicate in the same Modbus mode.
Holding register 2256	Modbus init	<b>IMPORTANT</b> The Modbus communication module must be restarted after changing any of the above settings. This can be done by either powering off and on the device or by executing the function "Modbus init". Please note that the settings in the menu will be updated after initialization of the Modbus communication module.
Holding register 2000	Modbus option	Indication: Modbus option /MB2, Modbus option /MB3 Indicates the selected ROTAMASS 3 Modbus communication option.
Holding register 2880	Master reset	Default: all parameters set to default except board constants, calibration constants, detector depending parameter and Concentration measuring settings in service menu. Settings of "Flex input register select □□" and "Flex holding register select □□" will be reset to zero.

## 8.5 Communication Status Register

ROTAMASS 3 Series Modbus communication type has implemented a “Communication Status Register” to signal logical errors like violation of data ranges, invalid selections or write protection at the time when a register is being written.

Values which are invalid or out of range will not be stored and the previous content of the register will be kept and returned to the host. The “Communication Status Register” will be updated with the last written register, the status, the access counts and the failed counts.

Writing to registers which are not accessible because of ROTAMASS 3 is in write protection mode or the option model is not correct will also be indicated in the “Communication Status Register”.

Values which consist of two or more registers like float values or ASCII values have to be written with the defined register size at once. When writing only single registers of the parameter (e.g. writing only 1 register of a 4 register ASCII value) the data will not be accepted and returns status information in the “Communication status register”.

When writing multiple registers the data will not be returned and as a consequence the master will not be able to check it. Therefore to make sure if these values are accepted and stored in the device the only solution is to read back the value after writing using another read command!

For details of Modbus communication refer to the specification

[http://www.modbus.org/docs/Modbus\\_Application\\_Protocol\\_V1\\_1b.pdf](http://www.modbus.org/docs/Modbus_Application_Protocol_V1_1b.pdf).

Parameter	Option /MB1	Option /MB2	Option /MB3	Flex input	Flex holding	Data format	16 bit Register	Read Write	Address			
									Holding register	Holding register Modicon	Input register	Input register Modicon
	R, W								4x			3x
<b>Modbus Communication Status</b>												
Holding Register	-	x	x	x	-	US16	2	R	6752	46753	87	30088
Access Status	-	x	x	x	-	US16	2	R	6753	46754	88	30089
Access Count	-	x	x	x	-	US16	2	R	6754	46755	89	30090
Failed Count	-	x	x	x	-	US16	2	R	6755	46756	90	30091

**Table 8.5.1 Modbus Communication Status**

Register	Parameter	Description and Setting
Holding register 6752	Holding Register	Indication: Holding register address of last Modbus transaction Indicates the address of the last read or written holding register.
Holding register 6753	Access status	Indication: Status of last Modbus transaction Indicates the status of the last read or write transaction acc. to table .
Holding register 6754	Access count	Indication: Count of Modbus transaction with success Indicates the summarized counts of successful transactions.
Holding register 6754	Failed count	Indication: Count of Modbus transaction which failed Indicates the summarized counts of unsuccessful transactions.

**Table 8.5.2 Modbus access status bit**

Access Status	Status bit	Status value	Priority	Description
Good	0x0000	0	low	The transmission of the value was successful.
Invalid selection	0x0001	1		The selected enumerator is not supported
Value out of range	0x0002	2		The received value is outside the allowed range
Not enough data	0x0004	4		The received data count is less than the register size.
Too much data	0x0008	8		The received data count is more than the register size.
Not readable	0x0010	16		The selected register is not readable (Write only register).
Not writable	0x0020	32		The selected register is not writable (Read only register).
Service Mode not open	0x0040	64		The service register of the ROTAMASS are not accessible.
Device in write protect Mode	0x0080	128		The ROTAMASS is in write protect mode.
Register not in option /MB2	0x0100	256		The selected register is not supported in the option /MB2.
Register not supported	0x0200	512	high	The selected register is not supported in the ROTAMASS.

## 8.6 Byte Order of Transmission

This section describes the transmission of values consist of two or more registers. In case of differences in the memory model of ROTAMASS 3 Series Modbus communication type and the host system it might be necessary to swap registers and/or single bytes.

The following registers define the transmission order.

These registers will not be changed after a "Modbus Init" or a "Master Reset".

Parameter	Option /MB1	Option /MB2	Option /MB3	Flex input	Flex holding	Data format	16 bit Register	Read Write	Address			
	Holding register	Holding register Modicon	Input register	Input register Modicon					4x			3x
<b>Modbus Byte order Setting</b>												
Byte Order Long Register	-	x	x	-	-	US16	1	R/W	6272	46273	-	-
Byte Order Float Register	-	x	x	-	-	US16	1	R/W	6288	46289	-	-
Byte Order String Register	-	x	x	-	-	US16	1	R/W	6304	46305	-	-

**Table 8.6.1 Modbus byte order setting**

Register	Parameter	Description and Setting
Holding register 6272	Byte order long register	Select: 0 to 3, default: 1 Set the order of the byte transmission for long values during the Modbus protocol. The default transmission order is "Low address first, high byte first" Make sure that host and ROTAMASS 3 use the same byte order for communication
Holding register 6288	Byte order float register	Select: 0 to 3, default: 1 Set the order of the byte transmission for float values during the Modbus protocol. The default transmission order is "Low address first, high byte first" Make sure that host and ROTAMASS 3 use the same byte order for communication
Holding register 6304	Byte order string register	Select: 0 to 1 Set the order of the byte transmission for string values during the Modbus protocol. The default transmission order is "High byte first" Make sure that host and ROTAMASS 3 use the same byte order for communication

### 8.6.1 Byte order of short value

Short value (2 byte)	Order code	34567		
		Byte 1	Byte 0	
Value in Hex		87	07	
Modbus Notation		A	B	
Modbus Register		Addr. n		
<b>Byte order (default)</b> (High byte first)	-	A	B	

#### NOTE

The order of the byte transmission for short values (single register) is fix during the Modbus protocol.

### 8.6.2 Byte order of long value

Long value (4 byte)	Order code	3456789			
		Byte 3	Byte 2	Byte 1	Byte 0
Value in Hex		00	34	BF	15
Modbus Notation		A	B	C	D
Modbus Register		Addr. n+1		Addr. n	
Byte order	0	A	B	C	D
<b>Byte order (default)</b> (Low address first, High byte first)	1	C	D	A	B
Byte order	2	B	A	D	C
Byte order	3	D	C	B	A

### 8.6.3 Byte order of float value

Float value (4 byte) (in IEEE-754 notation)	Order code	44.996628			
		Byte 3	Byte 2	Byte 1	Byte 0
Value in Hex		42	33	FC	8C
Modbus Notation		A	B	C	D
Modbus Register		Addr. n+1		Addr. n	
Byte order	0	A	B	C	D
<b>Byte order (default)</b> (Low address first, High byte first)	1	C	D	A	B
Byte order	2	B	A	D	C
Byte order	3	D	C	B	A

### 8.6.4 Byte order of string value

String value (6 byte)	Order code	123456					
		Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0
Value in Hex		31	32	33	34	35	36
Modbus Notation		A	B	C	D	E	F
Modbus Register		Addr. n		Addr. n+1		Addr. n+2	
<b>Byte order (default)</b> (High byte first)	0	A	B	C	D	E	F
Byte order	1	B	A	D	C	F	E

### 8.6.5 Example of float value transmission

The following illustration shows the storage of a float value in the IEE-754 format and the order of transmission in Modbus protocol on a typical example.

The mass flow value in user unit (holding register 528/529 decimal or 210/211 hex) should be read using Modbus command 3:

Storage in registers:

Float value	44.996628			
Byte number	Byte 3	Byte 2	Byte 1	Byte 0
Values in hex in IEEE-754 notation	42	33	FC	8C
Register no.	529 dec. (211 hex)			528 dec. (210 hex)

Transmission via Modbus (all values in hex):

Request from host	Device address	Function code	Start address	Number of registers	Checksum
	01	03	02 10	00 02	C4 76

Response from ROTAMASS	Device address	Function Code	Number of bytes	Data				Checksum 7B 3D	
	44.996628								
	01	03	04	Byte 1	Byte 0	Byte 3	Byte 2		
				FC	8C	42	33		
				Reg. 528 dec. (Reg. 210 hex)		Reg. 529 dec. (Reg. 211 hex)			

Because of the order of transmission the registers eventually need to be swapped to get the float value in the standard IEEE-754 format. Commercially available software might do this automatically. However, those users who intend to write their own communication software must be aware of the order of transmission when reading multiple registers and swap registers and/or bytes if necessary.

## 8.7 Transmission of Device Status Information

Modbus protocol is designed to reduce overhead. Therefore there is no continuous transmission of status information. ROTAMASS 3 Series Modbus communication type provides three holding and input registers to read the current status of error (Holding register 896, Input register 42), alarm (Holding register 912, Input register 43) and warning (Holding register 928, Input register 44) messages at the time when the registers are being read. History information is provided by ROTAMASS (Holding register 3264), alarm (Holding register 3265) and warning (Holding register 3266)

The number of error, alarm and warning messages corresponds with the bit number of the registers. If several messages are present at a time, all corresponding bits are set at once.

Register bit no.	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Error	E16	E15	E14	E13	E12	E11	E10	E9	E8	E7	E6	E5	E4	E3	E2	E1
Alarm	A16	A15	A14	A13	A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1
Warning	W16	W15	W14	W13	W12	W11	W10	W9	W8	W7	W6	W5	W4	W3	W2	W1

For a detailed description of meaning of and countermeasure for each error, alarm and warning message please see below or refer to chapter 8 of the standard instruction manual IM 01R04B04-00E-E.

## 8.7.1 Error, Alarm and Warning descriptions

EAW Code	EAW Bit value	EAW No.	Name	Meaning	Description
<b>Errors</b>					
0x0101	0x0001	E-01	Frequency fault	Frequency fault detected	Driving frequency out of range
0x0102	0x0002	E-02	Signal fault	Signal fault detected	Phase difference out of range
0x0103	0x0004	E-03	EEPROM fault	EEPROM fault detected	CRC-Error
0x0104	0x0008	E-04	CPU fault	CPU fault detected	Micro processor is not working
0x0105	0x0010	E-05	DSP fault	DSP fault detected	Micro processor is not working
0x0106	0x0020	E-06	Sensor 1 fault	Sensor 1 Signal fault detected	Sensor 1 signal below 7% for 3 min
0x0107	0x0040	E-07	Sensor 2 fault	Sensor 2 Signal fault detected	Sensor 2 signal below 7% for 3 min
0x0108	0x0080	E-08	Temp sens fault	Temperature Sensor Fault detected	T<-220°C or T>550°C
<b>Alarms</b>					
0x0201	0x0001	A-01	MF 1 criteria	Mass flow L Alarm	Mass flow below MF 1 criteria
0x0202	0x0002	A-02	MF 2 criteria	Mass flow H Alarm	Mass flow above MF 2 criteria
0x0203	0x0004	A-03	VF 1 criteria	Volume flow L Alarm	Volume flow below VF 1 criteria
0x0204	0x0008	A-04	VF 2 criteria	Volume flow H Alarm	Volume flow above VF 2 criteria
0x0205	0x0010	A-05	Dens. 1 criteria	Density L Alarm	Density below Dens. 1 criteria
0x0206	0x0020	A-06	Dens. 2 criteria	Density H Alarm	Density above Dens. 2 criteria
0x0207	0x0040	A-07	Temp. 1 criteria	Temperature L Alarm	Temperature below Temp. 1 criteria
0x0208	0x0080	A-08	Temp. 2 criteria	Temperature H Alarm	Temperature above Temp. 2 criteria
0x0209	0x0100	A-09	Conc. 1 criteria	Concentration L Alarm	Concentration below Conc. 1 criteria
0x020A	0x0200	A-10	Conc. 2 criteria	Concentration H Alarm	Concentration above Conc. 2 criteria
0x020B	0x0400	A-11	Netflow 1 crit.	Net flow L Alarm	Net flow below Net flow 1 crit.
0x020C	0x0800	A-12	Netflow 2 crit.	Net flow H Alarm	Net flow above Net flow 2 crit.
0x020D	0x1000	A-13	Total thr exceed	Total threshold exceed	Totalizer value exceeds total threshold
0x020E	0x2000	A-14	Slug detection	Slug flow detected	Slug criterion is reached
0x020F	0x4000	A-15	Empty pipe det.	Empty pipe detectd	Empty pipe criterion is reached
0x0210	0x8000	A-16	Corrosion det.	Corrosion detected	Corrosion criterion is reached
<b>Warnings</b>					
0x0301	0x0001	W-01	Density low	Density lower 0.3 kg/l	Density lower than 0.3 kg/l
0x0302	0x0002	W-02	Fixed dens act.	Fixed Dens selected	Parameter Dens fix val sel is enabled
0x0303	0x0004	W-03	Fixed temp act.	Fixed Temp selected	Parameter Temp fix val sel is enabled
0x0304	0x0008	W-04	Fixed MF active	Fixed MF selected	Parameter MF fix val sel is enabled
0x0305	0x0010	W-05	Autozero running	Autozero is running ...	Autozero process is performed, started by user action or status input
0x0306	0x0020	W-06	AZ val error	Autozero value out of range	Auto zero value is out of the internal detector depending range
0x0307	0x0040	W-07	AZ fluct error	Autozero fluctuation out of range	Auto zero fluctuation is out of the internal detector depending range
0x0308	0x0080	W-08	Sensor simul.	Sensor simulation active	Fixed frequency or fixed phase difference is enabled
<b>Warnings not available for option /MB2</b>					
0x0300	0x1000	W-09	Fixed Prim Out	Analog output 1 fixed	Analog output 1 fixed at 4mA for multidrop operation
0x030A	0x2000	W-10	Prim Out sat.	Analog output 1 saturated	Analog output 1 reaches less than 3.8mA or more than 20.5mA
0x030B	0x4000	W-11	Sec Out sat.	Analog output 2 saturated	Analog output 2 reaches less than 3.8mA or more than 20.5mA
0x030C	0x8000	W-12	Tert Out sat.	Pulse/Status output 1 saturated	Relation between pulse width and pulse rate of Pulse/Status output 1 is too high
0x030D	0x1000	W-13	Quart Out sat.	Pulse/Status output 2 saturated	Relation between pulse width and pulse rate of Pulse/Status output 2 is too high
0x030E	0x2000	W-14	Sec. Dig. Out. sat.	Sec. dig. out sat.	Analog output 2 saturated
0x030F	0x4000	W-15	In multidrop mode	In multidrop mode	Analog output 1 in multidrop operation
0x0310	0x8000	W-16	not used		

## 8.7.2 Reading of ordered errors, alarms and warnings

History Ordered	Addr. 3232 (43233)	EAW Code	EAW No.
History Ordered	EAW code (Register 1)	0x030A	W-10
	EAW code (Register 2)	0x0101	E-01
	EAW code (Register 3)	0x0000	-
	EAW code (Register 4)	0x0000	-
	EAW code (Register 5)	0x0000	-
	EAW code (Register 6)	0x0000	-
	EAW code (Register 7)	0x0000	-
	EAW code (Register 8)	0x0000	-
	EAW code (Register 9)	0x0000	-
	EAW code (Register 10)	0x0000	-

Clearing the table “History Ordered” can be performed by writing “0x01” (apply) to the holding register “Clear History ord” at address 3248 (43249).

## 8.7.3 Reading of absolute errors and warnings

History Abs. Entry 1-4	Addr. 3296 (43297)	EAW Bit/Date	EAW No. /Date
History Abs Entry 1	mm/dd (Register 1)	0x0919	09/25
	yyyy (Register 2)	0x07DD	2013
	E bit value (Register 3)	0x0001	E-01
	W bit value (Register 4)	0x0200	W-10
History Abs Entry 2	mm/dd (Register 5)	0x0916	09/22
	yyyy (Register 6)	0x07DD	2013
	E bit value (Register 7)	0x0002	E-02
	W bit value (Register 8)	0x0200	W-10
History Abs Entry 3	Entry 9 (Register 9)	0x0000	-
	Entry 10 (Register 10)	0x0000	-
	Entry 11 (Register 11)	0x0000	-
	Entry 12 (Register 12)	0x0000	-
History Abs Entry 4	Entry 13 (Register 13)	0x0000	-
	Entry 14 (Register 14)	0x0000	-
	Entry 15 (Register 15)	0x0000	-
	Entry 16 (Register 16)	0x0000	-

Writing a date value to the holding register “Clear History Abs” will store the actual register values of “History absolute” 3264 (43265) to the history and clears the “History absolute”.

Clear History Abs	Addr. 3360(43361)
ClearHistory Abs	mm/dd (Register 1)
	yyyy (Register 2)

Date	Date
0x0919	09/25
0x07DD	2013

## 8.7.4 Reading of Autozero Initial and history values

Autozero active values	Addr. 3888 (43889)
Autozero Active	AZ active value (Register 1/2)
	Density active value (Register 3/4)
	Temperature active value (Register 5/6)

Example	
0x5CAB	-13.4601
0xC157	
0x6A08	1.01105
0x3F81	
0x75CE	50.615
0x424A	

Autozero initialize values	Addr. 3904 (43905)
Autozero Initial	AZ initial value (Register 1/2)
	Density initial value (Register 3/4)
	Temperature initial value (Register 5/6)
	mm/dd (Register 7)
	yyyy (Register 8)

Example	
0x5CAB	-12.8794
0xC157	
0x6A08	1.0052
0x3F81	
0x75CE	50.6123
0x424A	
0x0901	09/01
0x07DD	2013

Autozero History Entry 1-2	Addr. 3920 (43921)
Autozero Initial Entry 1/2	AZ entry value (Register 1/2)
	Density entry value (Register 3/4)
	Temperature entry value (Register 5/6)
	mm/dd (Register 7)
	yyyy (Register 8)
	AZ entry value (Register 9/10)
	Density entry value (Register 11/12)
	Temperature entry value (Register 13/14)
	mm/dd (Register 15)
	yyyy (Register 16)

Example	
0x5CAB	-13.4601
0xC157	
0x6A08	1.01105
0x3F81	
0x75CE	50.615
0x424A	
0x091E	09/30
0x07DD	2013
0x6477	-13.3995
0xC156	
0x627B	0.942909
0x3F71	
0x754E	50.6146
0x424A	
0x0919	09/25
0x07DD	2013

Writing a date value to the holding register "Autozero to History" will store the actual register values of autozero, density and temperature to the history with the time stamp.

Clear History Abs	Addr. 944(40945)
Autozero to History	mm/dd (Register 1)
	yyyy (Register 2)

Date	Date
0x091E	09/30
0x07DD	2013

## 8.8 Transmission of Device Status Information

Modbus protocol is designed to support different communication speed in the range of 2400 to 115200 Baud. Depending on the selected baud rate the access time varies.

Therefore the total “transmission time” is composed of the  
 Command request time (depends on baud rate) +  
 ROTAMASS Access time +  
 Command responds time (depends on baud rate)

**Table 8.8.1 ROTAMASS Transmission Time**

Action	Transmission Time		
	Modbus Response time + Request time <sup>(1)</sup>	Access Time	
		ROTAMASS Reaction time <sup>(2)</sup>	ROTAMASS Storage time <sup>(3)</sup>
Fast reading of input or flex input register	< 9 ms	< 10 ms	-
Fast writing to flex holding register	< 9 ms	< 10 ms	500 ms max.
Fast execution of predefined holding register	< 9 ms	< 10 ms	500 ms max.
Reading from holding register	< 9 ms	around 500 ms	
Writing to holding register	< 9 ms	around 500 ms	

<sup>(1)</sup> Time the command needs for transmission (Example):

Modbus function code 6, writing of holding register,  
 Baud rate 19200Bd, 8 Data Bit, 1 Stop bit, 17 Bytes in total

<sup>(2)</sup> Time the ROTAMASS needs to react on the request from the master and send the response.

<sup>(3)</sup> Time the ROTAMASS needs to store the new value without burden or delay the Modbus communication.  
 Writing again to the same register during the storage time should be avoided.

## 8.9 Modbus Write Protection

Parameter	Option /MB1	Option /MB2	Option /MB3	Flex input	Flex holding	Data format	16 bit Register	Read Write	Address		
	Holding register	Holding register Modicon	Input register	Input register Modicon							
<b>Write protection</b>											
Write protect	-	x	x	x	-	US16	1	R	2896	42897	-
Key status	-	x	x	x	-	US16	1	R/W	2912	42913	-
Enable WRT 10 min	-	x	x	-	-	String	4	W	3840	43841	-
New password	-	x	x	-	-	String	4	W	3856	43857	-
Software seal	-	x	x	x	-	US16	1	R	3872	43873	-

**Table 8.9.1 Write protection**

Register	Parameter	Description and Setting
Holding register 2896	Write Protect	Yes: Write protection is activated. No: Write protection is deactivated. Write protect function is provided to inhibit parameter change. That becomes active by entering a password in "New password". Write protect status is released for 10 minutes by entering the password in "Enable wrt 10 min".
Holding register 3856	New password	Enter new password to change state of write protection. While write protect status is released, enter a new password twice, within 30 sec in "New Password".
Holding register 3840	Enable wrt 10 min	"Enable Write" release write protect status for 10 minutes. It will not be possible to set a new password when 10 minutes have elapsed. If a parameter, which is write enabled, is changed while the device is in "Enable wrt 10min", release time is extended for further 10 minutes.
Holding register 3872	Software seal	The first indication in Software seal menu is 'keep'. The "Software seal" menu is reserved as evidence so that user is able to confirm whether the Joker password is used or not. This evidence is saved. After the joker password setting it shows 'break'. After setting a new password and release via "Enable wrt 10 min", the Software seal shows "keep" again.
Holding register 2912	Key Status	Enable: Infrared keys are activated. Inhibit: Infrared keys are deactivated.

**NOTE**

- When the write protect function is active, data setting changes in all parameters of RCC□3 are inhibited and cannot be changed using the Modbus register. Also the setting via the infrared pushbuttons is prohibited.
- If 8 characters are input as "space", the Write protect function is in release status irrespective of time.
- If RCC□3 powers off and on again within 10 minutes after releasing of write protect status, "Enable Write" becomes unavailable.

**NOTE**

The specific register

- "Device address", holding register 512
- "Baud rate, Data format", holding register 513
- "Modbus mode", holding register 514

are not write protected during the write protection is active.

They should not be changed via Modbus during this device status.

# 9. MODBUS COMMUNICATION TOOL

## 9.1 Preconditions

The Modbus Communication Tool was designed to support the parameters and values of the ROTAMASS 3 Series Modbus communication type which are available via Modbus.

The Modbus Communication Tool supports the same communication settings as ROTAMASS.

Baud rates: 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200

Data formats: 8E1, 8O1, 8N2, 8N1

Modbus modes: RTU, ASCII

The Modbus Communication Tool was successfully tested on the following operating systems:

Win XP 32bit, Win 7 32bit, Win 7 64bit

The Modbus Communication Tool uses the .NET 2.0 Framework from Microsoft. The installer will check the availability of .NET 2.0 and ask you for installation if necessary.

The Modbus Communication Tool is provided on a "AS IS" basis. Although it might work on other Windows versions and with other Modbus devices this was not tested and Rota Yokogawa does not provide any liability, warranty or support for its use.

## 9.2 Installation and Start

The Modbus Communication Tool comes with installers for 32bit and 64bit operating systems. Please select the appropriate installer according to the operating system installed on your computer. If in doubt please check the documentation of your operating system.

For the installation administrator privileges are required. If you do not possess administrator privileges please contact your system administrator for installation.

After successful installation an entry in your start menu will be generated and an icon will be placed on your desktop. To start the application simply double-click on the entry in the start menu or on the desktop icon.

## 9.3 Using the Modbus Communication Tool

After starting the Modbus Communication Tool by double-clicking the entry in the start menu or the desktop icon a pop-up window with logo and disclaimer will appear. Please read and confirm. In the next window the communication settings are shown. Here the device address, COM port of the computer, baud rate, data format and Modbus mode can be adjusted.

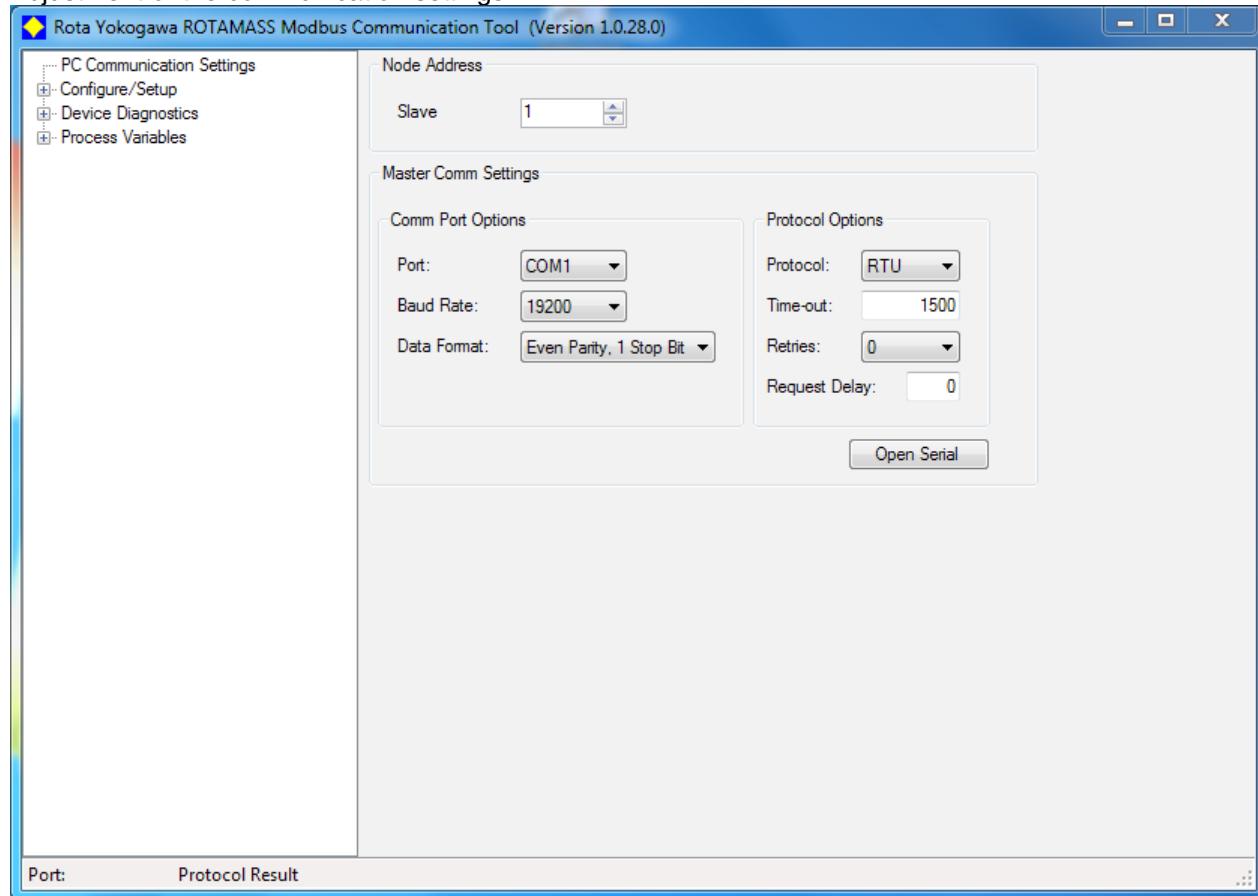

### NOTE

The default settings are device address 1, 19200 baud, data format 8E1, Modbus RTU.

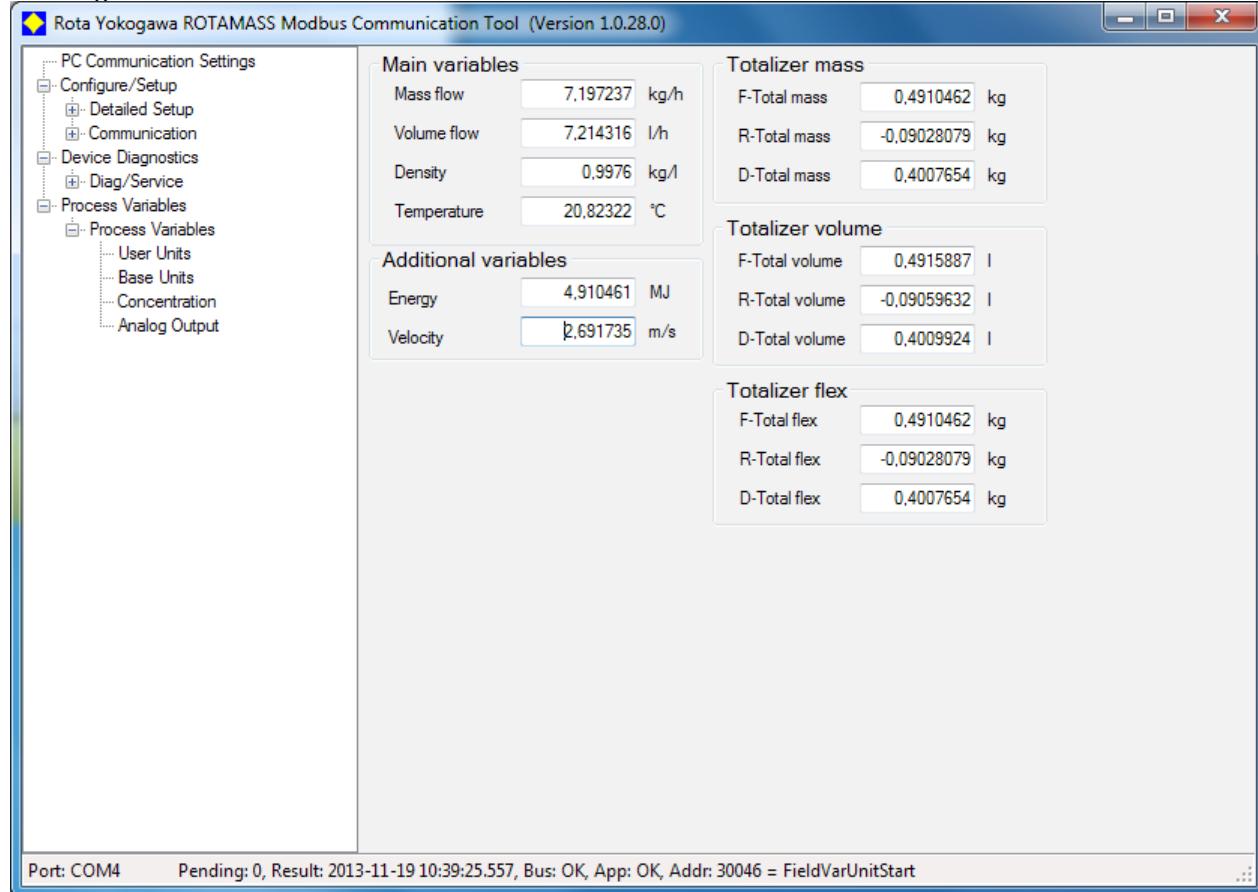

Make sure that all communication settings of the computer and the connected ROTAMASS match. To establish a connection check also proper wiring of the lines A (D-) and B (D+) between the RS485 interface and ROTAMASS.

After opening the COM port by pressing the button the connection will be tested and the result will be indicated.

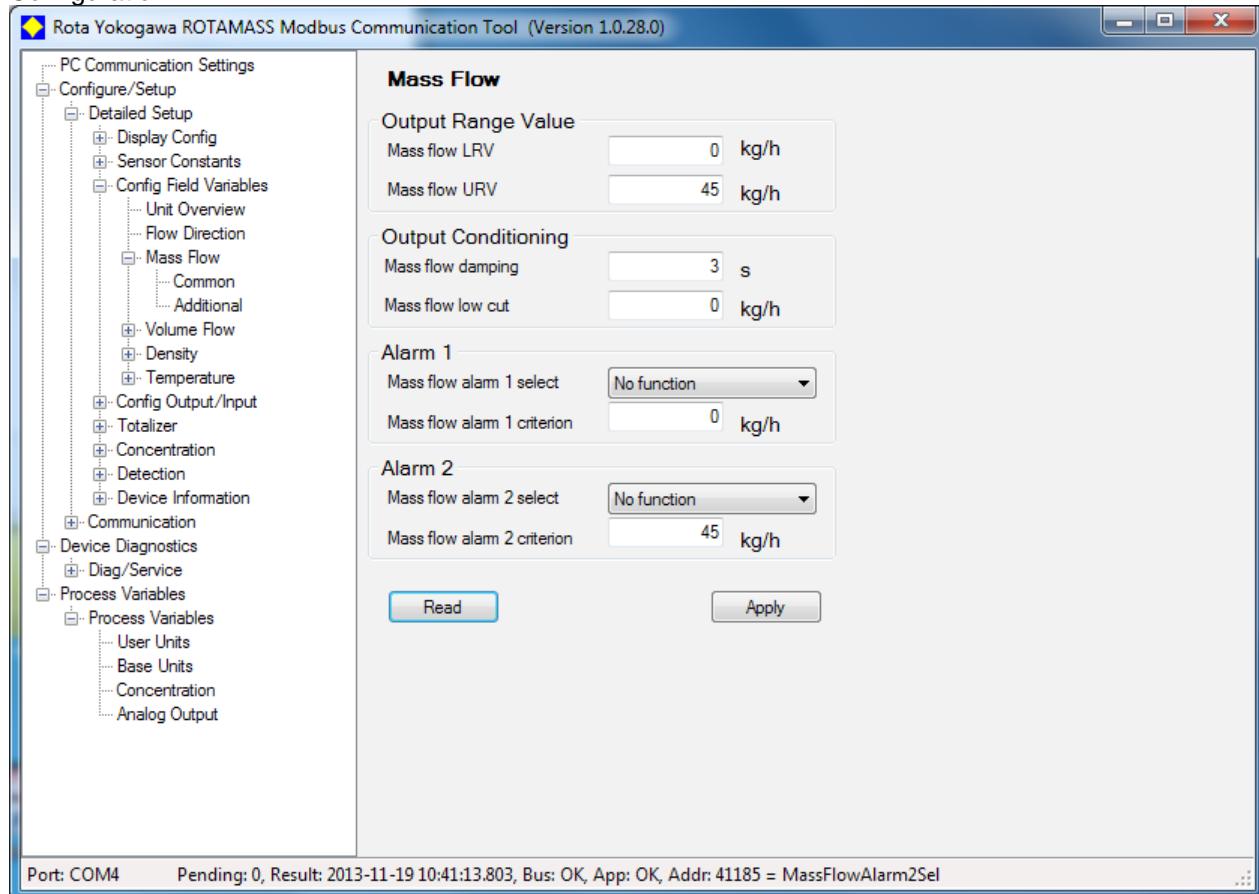

## Adjustment of the communication settings
